Executive Summary

As a part of the Draft Environmental Impact Statement (EIS) for the Earthquake Ready Burnside Bridge (EQRB) Project (Project), this Hazardous Materials Technical Report has been prepared to identify and evaluate potential hazardous materials impacts within the Project's Area of Potential Impact (API).

This report identifies hazardous substance sites of concern and comparatively evaluates the environmental issues those sites may present to the construction and operation of the Project Alternatives.

Long-term impacts identified for the Build Alternatives include the following:

- Long-term impacts (post-construction) can occur where hazardous materials might remain present on properties acquired for the Project and could potentially impact humans and/or the environment after the Project is constructed. If proper cleanup is implemented, this can have a net beneficial impact for the environment.
- Operation of the EQRB above ground and its roadway elements is not expected to affect existing hazardous materials in the soil and/or groundwater. However, the operation of new facilities installed underground, such as utilities, could have impacts on future cleanup efforts. New pipelines, duct banks, or conduits could physically impede cleanup of soil or groundwater, requiring that either the contamination be left in place or that the cleanup operation take extra measures to protect and support the utilities.
- Potential adverse impacts due to existing riverine sediment contamination were identified. Long-term impacts from sediments could occur through releases of contaminants due to scouring and changes in river dynamics associated with the constructed piers.
- Operation of the roadway may result in the release of hazardous substances or petroleum products into the environment from accidental spills. The Build Alternatives would not substantially change traffic operations compared to the No-Build Alternative; thus, the impacts from accidents and spills are not expected to be significantly different among the Build Alternatives as compared to the No-Build Alternative.

Short-term impacts were identified and are primarily associated with construction-related activities:

- The Project has a potential for adverse effects from property acquisition liability if not correctly mitigated.
- The Project has the potential for adverse effects to the environment from disturbance of existing contaminated soils or accidental releases during construction.

- Surface water quality can be adversely affected by near-water or in-water construction activities. Over-water activities such as bridge demolition and construction could also adversely affect surface water quality.
- The Project has a potential for adverse effects to the environment from the disturbance of riverine sediment contamination. Disturbance of existing sediment contamination is of most concern in near-shore environments where pier installation and scour could occur. These construction activities can re-suspend contaminants into the water column, re-deposit contaminated sediments, or expose residual sediment contamination.

The degree of the potential impacts generally increases as additional infrastructure and construction activities are added for the Build Alternatives. However, the increase in potential impacts are not such that one Build Alternative has substantially greater adverse impacts (or beneficial affects) than another; solely based on hazardous materials in the absence of mitigation strategies.

Mitigation of construction-related impacts from hazardous materials could be accomplished through implementing proper measures and planning. Such measures could include conducting due diligence before potentially contaminated property is acquired; surveying for and abating hazardous building materials before structures are demolished; appropriately addressing known contamination or other environmental issues in the project footprint; and developing and implementing plans to protect worker health and safety, address contaminated materials discovered during construction, and prevent and control spills and stormwater contamination.

Mitigation of operational impacts from hazardous materials could be accomplished by implementing measures and planning. Such measures could include training and informing maintenance personnel regarding hazardous materials and hazardous materials–related conditions that would exist or could be encountered during maintenance work. These measures could also include developing protocols for maintenance work regarding spill response and agency notification.

1 Introduction

As a part of the preparation of the Environmental Impact Statement (EIS) for the Earthquake Ready Burnside Bridge (EQRB) Project (Project), this Hazardous Materials Technical Report has been prepared to identify and evaluate potential hazardous materials impacts within the Project's Area of Potential Impact (API).

1.1 Project Location

The Project Area is located within the Central City of Portland. The Burnside Bridge crosses the Willamette River connecting the west and east sides of the city. The Project Area encompasses a one-block radius around the existing Burnside Bridge and W/E Burnside Street, from NW/SW 3rd Avenue on the west side of the river to NE/SE Grand Avenue on the east side. Several neighborhoods surround the area including Old Town/Chinatown, Downtown, Kerns, and Buckman. Figure 1 shows the Project Area.

1.2 Project Purpose

The primary purpose of the Project is to build a seismically resilient Burnside Street lifeline crossing over the Willamette River that will remain fully operational and accessible for vehicles and other modes of transportation following a major Cascadia Subduction Zone (CSZ) earthquake. The Burnside Bridge would provide a reliable crossing for emergency response, evacuation, and economic recovery after an earthquake. Additionally, the bridge would provide a long-term safe crossing with low maintenance needs.

2 Project Alternatives

The Project Alternatives' design, operations and construction assumptions are described in detail in the EQRB Description of Alternatives Report (Multnomah County 2021a). That report describes the Alternatives' current design as well as operations and construction assumptions.

Briefly, the Draft EIS evaluates the No-Build Alternative and four Build Alternatives. Among the Build Alternatives there is an Enhanced Seismic Retrofit Alternative that would replace certain elements of the existing bridge and retrofit other elements. There are three Replacement Alternatives that would completely remove and replace the existing bridge. In addition, the Draft EIS considers options for managing traffic during construction. Nomenclature for the Alternatives/Options includes the following:

- No-Build Alternative
- Build Alternatives
  - Enhanced Seismic Retrofit (Retrofit Alternative)
  - Replacement Alternative with Short-span Approach (Short-span Alternative)
  - Replacement Alternative with Long-span Approach (Long-span Alternative)
  - Replacement Alternative with Couch Extension (Couch Extension Alternative)
- Construction Traffic Management Options
  - Temporary Detour Bridge Option (Temporary Bridge) includes three modal options:
    - Temporary Bridge: All modes
    - Temporary Bridge: Transit, Bicycles and Pedestrians only
    - Temporary Bridge: Bicycles and Pedestrians only
  - Without Temporary Bridge Option (aka, No Temporary Bridge)

Please see the EQRB Description of Alternatives Report (Multnomah County 2021a) for text, maps, and graphical descriptions of the Alternatives.

3 Definitions

The following terminology is used when discussing geographic areas:

- **Project Area –** The area within which improvements associated with the Project Alternatives would occur and the area needed to construct these improvements. The Project Area includes the area needed to construct all permanent infrastructure, including adjacent parcels where modifications are required for associated work such as utility realignments or upgrades. For the EQRB Project, the Project Area includes approximately a one-block radius around the existing Burnside Bridge and W/E Burnside Street, from NW/SW 3rd Avenue on the west side of the river to NE/SE Grand Avenue on the east side.
- **Area of Potential Impact (API) –** This is the geographic boundary within which physical impacts on the environment could occur with the Project Alternatives. The API is resource-specific and differs depending on the environmental topic being addressed. For all topics, the API encompasses the Project Area, and for some topics the geographic extent of the API is the same as that for the Project Area; for other topics (such as for transportation effects) the API is substantially larger to account for impacts that could occur outside of the Project Area. The API for hazardous materials analysis is defined in Section 5.1.
- **Project vicinity –** The environs surrounding the Project Area. The Project vicinity does not have a distinct geographic boundary but is used in general discussion to denote the larger area, inclusive of the Old Town/Chinatown, Downtown, Kerns, and Buckman neighborhoods.
- **Hazardous material –** Any item or agent (biological, chemical, radiological, and/or physical) that has the potential to cause harm to humans, animals, or the environment, either by itself or through interaction with other factors.
- **Recognized Environmental Condition –** The presence or likely presence of any hazardous substances or petroleum products in, on, or at a property (1) due to release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment (ASTM 2013).
- **Underground storage tank (UST) –** Any tank, including underground piping connected to the tank, that is or has been used to contain hazardous substances or petroleum products and the volume of which is 10 percent or more beneath the surface of the ground. Releases from USTs caused by leaks, spills, and overfills from UST systems present major risks to human health and the environment. The U.S. Environmental Protection Agency (EPA) has developed regulations, primarily implemented at the state level, to register all USTs and ensure that leak detection, spill, overfill, and corrosion protection requirements are met.

4 Legal Regulations and Standards

4.1 Laws, Plans, Policies, and Regulations

4.1.1 Federal Environmental Protection Agency Laws

The following federal rules and regulations were used to guide data collection for hazardous material sites in the Project Area. These rules and regulations are implemented and enforced by the EPA.

- Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) 1980 (42 United States Code [USC] 9601 et seq.). CERCLA is a federal law designed to clean up sites contaminated with hazardous substances as well as broadly defined "pollutants or contaminants." CERCLA's broad authority to clean up releases or threatened releases of hazardous substances that may endanger public health or welfare or the (natural) environment was given primarily to the EPA.
- Resource Conservation and Recovery Act (RCRA) of 1976 (42 USC 6901 *et seq.*). Regulations promulgated under RCRA set standards for the treatment, storage, and disposal of hazardous waste in the United States.
- Clean Water Act of 1972, amended in 1977 and 1987 (33 USC 1251–1387). This is the primary federal law governing water pollution, and its objective is to restore and maintain the chemical, physical, and biological integrity of the nation's waters by preventing point and nonpoint pollution sources, providing assistance to publicly owned treatment works for the improvement of wastewater treatment, and maintaining the integrity of wetlands.
- The Superfund Amendments and Reauthorization Act of 1986 (42 USC 9601 *et seq.*) amended CERCLA and requires Superfund actions to consider requirements found in other state and federal environmental laws and regulations and increased the focus on human health problems posed by hazardous waste sites.
- Federal Insecticide, Fungicide and Rodenticide Act (FIFRA) of 1972 (7 USC 136 *et seq.*). FIFRA provides federal regulation of the distribution, sale, and use of pesticides.
- Toxic Substances Control Act (TSCA) of 1976, updated in 2016 (15 USC [C. 53] 2601–2692). TSCA provides regulation over the production, importation, use, and disposal of chemical substances including PCBs, asbestos, radon, and lead-based paint.

4.1.2 State of Oregon and Local Government Regulations

The following state and local rules and regulations were used to guide data collection for hazardous materials sites in the Project Area. These rules and regulations are implemented and enforced by the Oregon Department of Environmental Quality (DEQ):

- Hazardous Waste and Hazardous Materials I and Hazardous Waste and Hazardous Materials II (2003 Oregon Revised Statutes 465 and 466, as amended). Provides guidance for the protection of public health and safety from hazardous waste,

regulation on the reduction of the use of toxic substances and hazardous waste generation, and rules and regulations for the storage, treatment, and disposal of hazardous waste and polychlorinated biphenyls (PCBs).

- Underground Storage Tank Rules, 1990 (Oregon Administrative Rules [OAR] 340-150). Provides rules and regulations for the operation and management of USTs, including leak protection standards, compliance, training, construction specifications, and decommissioning requirements.
- Residential Heating Oil Underground Storage Tanks, 1998 (OAR 340-177). Specifies requirements for the cleanup of releases of petroleum from residential heating oil USTs, decommissioning requirements, and service provider reporting requirements.
- Groundwater Quality Protection, 1998 (OAR 340-040). Establishes rules for the mandatory minimum groundwater protection requirements for federal and state agencies, cities, counties, industries, and citizens.
- Environmental Hazards Notice, 1998 (OAR 340-130). Requires notice of locations of and alterations to potentially hazardous sites to protect public health, safety, and the environment.
- Standards Applicable for Dry Cleaning Stores Facilities and Dry Stores, 2002 (OAR 340-124). Provides the waste minimization requirements specifically for dry cleaning facilities and dry stores.
- Illegal Drug Lab Cleanup Assistance, 1999 (OAR 340-140). Establishes the policies of DEQ when responding to a request made by law enforcement for assistance with the cleanup of hazardous materials and chemicals related to the production of illegal drugs.
- Hazardous Waste Management System, 2003 (OAR 340-100 to 110, 120, 124 and 142). Controls hazardous waste from the time of generation through transportation, storage, treatment, and disposal.
- Hazardous Substance Remedial Action Rules, 1997 (OAR 340-122). Establishes standards and procedures for the determination of removal and remedial action necessary to ensure protection of public health, safety and welfare, and the environment in the event of a release or threat of a release of a hazardous substance.

4.2 Design Standards

There are no applicable design standards required by federal, state, and local law, or by agency policy that, besides any listed in the above plans and policies, relate to hazardous materials impacts.

5 Affected Environment

5.1 Area of Potential Impact

The API established for the hazardous materials analysis includes an approximately 0.25-mile buffer around the Project Area (see Figure 2). The use of this API allows for a comprehensive records search of hazardous materials sites near the Project Area that have potential for impacts, including direct long-term and short-term impacts, and includes those sites, if any, that have relatively large subsurface contamination footprints (i.e., groundwater plumes) that could be encountered in the construction of the Project Alternatives.

5.2 Resource Identification and Evaluation Methods

5.2.1 Published Sources and Databases

Existing conditions within the Project Area were assessed for the presence or suspected presence of hazardous substances and petroleum products. Assessment procedures were developed to comply with the National Environmental Policy Act and to address other federal, state, and local regulations and policies. The assessment for the presence of hazardous materials sites generally follows methodology developed by the American Society for Testing and Materials (ASTM) Standard E1527-13, Standard Practice for Environmental Site Assessments. However, the process was modified for the specific goals of this assessment in the context of a Draft EIS to include the following components:

- Review of federal and state environmental databases for potential sites within the Project Area.
- Historical and existing land uses, including review of available Sanborn Fire Insurance Maps and aerial photographs.
- Site reconnaissance from public right-of-way to assess potential environmental conditions that may indicate where hazardous materials may be present.

Regulatory Databases

A search of federal and state regulatory database records was conducted by Environmental Data Resources, Inc. (EDR). In general, the database search report meets the government records search requirements of the abovementioned ASTM Standard E1527-13 (ASTM 2013). Tables 1 through 6 include the environmental databases that were searched to provide information regarding known, as well as potential, hazardous materials sites.

Historical Land Use

Historical land use information was reviewed using available and relevant fire insurance maps (Sanborn maps), aerial photographs, available chain-of-title reports, and records of historical land use decisions.

Sanborn maps typically show historical features of current or former buildings, including hazardous chemical or fuel storage areas, potential release pathways (i.e., drains), and use of properties. Additional information includes site address, building materials, property boundaries, utility lines, and underground storage tanks. Sanborn maps were limited to within approximately 1/8 mile of the Project Area (i.e., immediately adjacent and nearby properties).

Aerial photographs can be used to discern past or current commercial and industrial land uses that have the potential to be impacted by the Project. Aerial photographs were reviewed from the mid-1930s to the present in approximately 10-year intervals.

Other Data Sources

As available and appropriate, data from previous technical reports and agency file reviews were collected on sites showing indicators of concern during the regulatory database review or Sanborn map review. Indicators of concern include active and known DEQ or EPA cleanup sites, operations, or facilities that have the potential to impact the subsurface, as well as other known or perceived environmental conditions, spills, etc., that are found to have a potential to impact the Project. In some cases, specific DEQ file

reviews were conducted on a specific parcel or site. Field reviews were also conducted to confirm findings from database reviews and to view areas of high concern.

5.2.2 Field Visits and Surveys

A site reconnaissance was conducted to view properties within the Project Area and adjacent areas. The reconnaissance was completed to further evaluate environmental conditions that may indicate where hazardous materials may be present. The site reconnaissance was used to obtain information indicating the likelihood of identifying recognized environmental conditions (RECs) to the Project Area. The following were observed: current land use of the Project Area, current use of adjoining properties within the API, and geologic, hydrogeologic, hydrologic, and topographic conditions of the API. Additionally, where access and visible observations allowed, scientists looked for the presence of hazardous substances and petroleum products used or stored on sites within the Project Area, such as in tanks, pools of liquid, drums, hazardous substance containers, petroleum product containers, unidentified substance containers, PCBs, fuel sources for heating/cooling systems, stains or corrosion, drains and sumps, pits, ponds, lagoons, stained soil or pavement, stressed vegetation, solid waste, wastewater, wells (drywells, monitoring wells, injection wells), and septic systems.

5.3 Existing Conditions

5.3.1 Physical Setting

Aspects of the physical environment that affect the hazardous materials analysis include topography, geology, and hydrogeology. This section describes the environmental characteristics that affect the presence and movement of hazardous materials in the vicinity of the Project Area.

Topography

The topography of the Project vicinity was generally formed by catastrophic flood events of the Columbia River and the volcanic activities of the Cascadia subduction system (see Figure 3). The dominant topographical features of the area include the north-south trending Tualatin Mountains to the west (the west hills), the Cascade Range to the east, and the convergence of the westward flowing Columbia River and the northwestward flowing Willamette River. The City of Portland lies within the Portland Basin, which is characterized by past catastrophic flooding and subsequent sediment deposits of the Willamette and Columbia Rivers. Development of the city of Portland has included extensive placement of fill in areas adjacent to the Willamette River and in catastrophic flood channels near the river.

Figure 3. Topographic Map

Source: USGS, HDR, Parametrix, DOGAMI (2014 Lidar)

The City of Portland is generally divided by the Willamette River situated north-south, creating a natural east-west division. The western portion is generally flat traveling from the Willamette River to the west until the gradual incline of the Tualatin Mountains begins approximately one mile to the west of the Willamette River. The eastern portion of the city is generally flat with several buttes and outcroppings to the far east of the Willamette River. The API and Project Area straddle the Willamette River, and are relatively flat with the land on the east side of the river gently sloping west toward the river and the land on the west side of the river gently sloping east toward the river.

Geology

Geologic conditions in the greater Portland area have been heavily influenced by both distant and local tectonic, volcanic, and climatic events. The API lies within the Portland Basin, one of several depressions that constitute the Puget-Willamette forearc trough of the Cascadia subduction system. The Portland Basin is bordered by the Tualatin Mountains (part of the Coast Range) to the west and the active volcanic Cascade Range to the east and is composed of a mixture of volcanic and sedimentary rocks and alluvium of varying ages. The area is underlain by Quaternary catastrophic flood alluvium deposits (Bretz/Missoula floods), and the underlying geologic units of the area are Miocene-Pleistocene sediments formed by tectonic, volcanic, and environmental events which introduced a variety of materials into the basin (DOGAMI 2012). The confluence of the Willamette and Columbia Rivers is located approximately 10.5 miles to the northwest of the API.

Within the API, the eastern and western shores of the Willamette River are composed of artificial fill (Holocene) which is made up of sand, silt, and clay with some amounts of gravel and debris. Beyond the eastern shore, the Project Area is composed of channel facies sediments and variable silt, sand, and gravel characteristic of deposits found in

major flood channels. Most of the eastern side of the river is composed of fine-grained facies, coarse sand to silt deposited by catastrophic floods, with a layer of gravel present near the surface. Beyond the layer of artificial fill to the west, the Project Area is composed of alluvium, river and stream deposits of silt, sand, and organic-rich clay with some gravel content.

Soil properties and the presence of groundwater influence the mobility and migration of contaminants. While there are differences in the way different contaminants migrate in soil and groundwater, in general, there is more movement when there is groundwater present and when the soils are more porous, such as with gravels and sands. Dominant soil composition on the west bank of the Willamette is Pilchuck sand, characterized by high infiltration rates, and deep well-drained sands and gravels. The east bank is mostly composed of fine-grained sandy silt and sand underneath a layer of fill. Additional information and detail can be found in the EQRB Geology and Soils Technical Report (Multnomah County 2021b).

Hydrogeology

The regional Willamette Lowland aquifer system is generally defined by the geologic units encountered in the area. The Troutdale Gravel Aquifer is the predominant water-producing aquifer in the region; it occurs at varying depths in the Project Area as it

was deposited by the Columbia River and streams from the Cascade Range (Gannett and Caldwell 1998). An alluvial aquifer system known as the unconsolidated sedimentary aquifer overlies the less permeable Troutdale Gravel Aquifer. Groundwater depth and flow in the unconsolidated sedimentary aquifer generally follows the topography of the area, and the Willamette River functions as its discharge boundary. The river stage of the Willamette River fluctuates seasonally between approximately 6 to 20 feet in elevation, and it experiences some tidal influence. Based on historical boring logs, depth to groundwater on the east side of the Willamette River ranges from approximately 14 feet below ground surface (bgs) to 50 feet bgs, and on the west side depth to groundwater is approximately 14 feet bgs (Shannon & Wilson 2017). Groundwater levels in the API are expected to vary seasonally with precipitation levels, river stage, and with topographical contours. Higher groundwater is expected to be encountered in early winter until late spring, while groundwater lows are expected to occur in summer and late fall.

River Sediments

The API is located within the area designated as the Downtown Reach of the Willamette River, which has been heavily developed and modified during the past 150 years. Various industrial activities have occurred on the banks of the river, including ship building and breaking, heavy manufacturing, pesticide formulating, manufactured gas production, power generation and distribution, and lumber processing. As a result of these activities, contaminants may have reached the river and settled into the riverbed sediment. Pathways for contamination to reach the river include riverbank erosion, surface runoff, stormwater discharges, wastewater discharges, on-water activities, spills, and groundwater discharges.

The Project Area is situated at approximately river mile (RM) 12.2 of the Willamette River, within the Downtown Reach. The Downtown Reach is located immediately upriver (south) of the area designated as the Portland Harbor Superfund Site (ECSI Site ID 2068) (see Figure 4), which is listed primarily for sediments contaminated with petroleum products (polycyclic aromatic hydrocarbons [PAHs]), PCBs, and pesticides, along with a number of other chemicals and compounds. Extensive investigation and cleanup actions have been conducted for the Portland Harbor Superfund Site (see Section 5.3.2).

While the API is located outside and upgradient of the Portland Harbor Superfund Site, information obtained from DEQ indicates that sediment contamination within the Downtown Reach is likely present (and has been confirmed in many areas). As part of the Portland Harbor investigation activities, as well as some limited independent actions, a number of sediment investigations have been conducted within and near the Downtown Reach, including the area between RM 12.1 and 12.5, where the EQRB Project Area is located. DEQ has overseen multiple sediment investigations and five major sediment cleanup actions in the 4-mile Downtown Reach. Although specific sediment data within the API are limited, DEQ and EPA have concluded that concentrations of contaminants in the Downtown Reach are substantially lower than those found in sediments within the Portland Harbor Superfund Site. DEQ expects that concentrations of contaminants in surface sediments in the Downtown Reach will decline over time as the in-water sources are addressed, upland sources are controlled, and natural recovery mechanisms take effect (DEQ 2018).

Figure 4. Highest Ranking Hazardous Material Sites

Additional information and analysis associated with scouring and modifying river sediment dynamics through Project construction can be found in the draft EQRB Hydraulic Impact Analysis Technical Report (Multnomah County 2021c).

5.3.2 Results of the Regulatory Database Review

The primary source of database records was a report provided by EDR, compiled on June 12, 2019 (Appendix B). The database search identified 1,389 potential hazardous materials site records within the search area. Many of the site records are duplicates or include multiple record updates within a single property such that the total number of sites is significantly smaller. Some sites were identified on one or more of the regulatory databases reviewed. The most relevant, or priority, databases are listed below.

State (Oregon) Regulatory Databases

- Leaking Underground Storage Tank (LUST)
- Underground Storage Tank (UST)
- Voluntary Cleanup Program (VCP)
- Environmental Cleanup Site Information (ECSI)
- Drycleaners
- Spills
- Brownfields (Oregon)
- Recovered Government Archive (RGA) LUST

Federal Regulatory Databases

- Superfund Enterprise Management System (SEMS) and SEMS Archive
- National Priority List (NPL)
- Corrective Action Sites (CORRACTS)
- Emergency Response Notification System (ERNS)
- Brownfields (US)

Table 7 shows the number of hazardous materials sites identified on the priority databases within the Project Area and the API. Some sites are listed on multiple databases; therefore, the total number of sites shown in Table 7 is greater than the total number of known sites within the Project Area and API.

Table 7. Number of Sites Identified on Regulatory Databases within Project Area

Database	Sites within Project Area	Sites within API*
UST	4	54
LUST	20	114
RGA LUST	21	155
OR SPILLS	12	46
VCP	4	14
ECSI	5	22
DRYCLEANERS	0	8
OR BROWNFIELD	1	2
SEMS	0	0
SEMS-ARCHIVE	0	3
NPL	0	0
CORRACTS	0	0
ERNS	1	5
US BROWNFIELD	1	1

*The number shown for the API includes sites within the Project Area.

The identified sites were evaluated to develop a list of sites with the highest potential to be encountered by the Project. The identified sites were ranked based on the proximity to the Project Area, the type and number of databases in which the site was found, known releases of hazardous materials or petroleum products, and the status of cleanup at sites with known releases. Sites were ranked on a scale of 1 to 3 (high priority to low priority) as follows:

1. Identified site is within the Project Area and is listed in a priority database with no indication that the site has been cleaned up or given a No Further Action (NFA) by the regulator. In some cases, depending on site details, a site within the Project Area which received an NFA determination is retained as a 1-ranked site due to remaining issues which could impact the Project. All sites ranked as 1 are considered priority hazardous materials sites.
2. Identified site is between the Project Area and 400 feet from the Project Area and is listed in a priority database *or* is an identified site within the Project Area and is listed in a priority database, but site details indicate cleanup at the site is complete or the regulator has given an NFA notice.
3. Identified site is between 400 feet and 1/8 mile from the Project Area or is identified in a non-priority database within the Project Area.

Figure 5 shows the locations and ranking of potential hazardous materials sites identified in regulatory databases within the search area. The table in Appendix A lists all sites found in the regulatory database search and their EDR ID which corresponds to the identifying numbers in the EDR Radius Report (Appendix B). The table in Appendix A lists the proximity of each site to the construction limits of the Project and the ranking assigned to the site using the criteria as described above.

Further evaluation was completed for each site with a rank of 1 to compile a final list of sites that are of the highest potential concern to the Project. The evaluation included information on the extent and nature of previous releases, as well as the distance from the Project Area. Based on this analysis, the sites ranked as 1 have the highest potential to impact the Project and are listed in Table 8 and shown on Figure 4. Specific information available for each of these sites is summarized after Table 8.

Table 8. EDR-Identified Priority Sites

Map ID	Site Name	Address	Parcel Number	Databases	Potential Contaminants
F187, AP999	Portland Gas Works (East Portland Gas Works, East Side Gas Works)	110 SE 2nd Ave, 5 SE Martin Luther Kind, Jr. Blvd	1N1E34DD-01400 and 1N1E34DD-00400	ECSI, MGP	Petroleum hydrocarbons, PAHs, BTEX, trimethylbenzenes, metals, cyanide, PCBs
AP999	Gas Holder Tank Site (Former)	5 SE Martin Luther Kind, Jr. Blvd	1N1E34DD-00400	LUST, VCP, US Brownfields	Petroleum hydrocarbons, PAHs, BTEX, trimethylbenzenes, metals, cyanide, PCBs
F1013	Towne Storage Property LLC (Pacific Iron Works)	17 SE 3rd Ave	1N1E34DD-00800	ECSI, LUST, VCP	Petroleum hydrocarbons
AB620	North Waterfront Park	100-500 NW Front Ave	N/A	ECSI	Petroleum hydrocarbons, PAHs, BTEX,
AB651	PDC Block 8L Downtown Waterfront	60 NW Davis St	1N1E34DB-00200	ECSI, Engineering Controls, Institutional Controls, VCP	Petroleum hydrocarbons, PAHs, metals,
AB514, AB515, AB516	Old Town Parking/Helistop Structure	33 NW Davis St	1N1E34DB-00100	ECSI, CRL, RGA HWS	Petroleum hydrocarbons, PAHs, metals
AB647	Block 15 – Former Portland Gas Manufacturing Site	121 NW Everett St	1N1E34CA-04400	ECSI, Engineering Controls, Institutional Controls, VCP	PAHs
707	Portland Gas Manufacturing Site	Bounded by NW Everett, Glisan, 2nd Ave, and the Willamette River	Multiple	SEMS-ARCHIVE, VCP, ECSI	PAHs, VOC, petroleum hydrocarbons, metals
N/A	Portland Harbor Superfund Site	Willamette River	N/A	ECSI, numerous	TPH, PAHs, PCBs, pesticides, metals

Notes: BTEX = benzene, toluene, ethylbenzene and xylene; PAHs = polycyclic aromatic hydrocarbons; PCBs = polychlorinated biphenyls; VOC = volatile organic compound.
Map IDs refer to labels on EDR map in Appendices A and B.

Portland Gas Works, 110 SE 2nd Avenue (also listed as East Portland Gas Works – Gas Holder Tank Site, **5 SE Martin Luther King Jr. Blvd),** encompasses tax lot 1400 (block bounded by SE Ankeny Street to the north, SE 2nd Avenue to the west, SE Ash Street to the south, and SE 3rd Street to the east) and was a former gas manufacturing plant in the late 1800s. Gas holder tanks were present on the site, as well as on the southwestern corner of block 950, tax lot 400 to the northeast. The block (1400) was redeveloped in the 1990s, and contaminated soil was confirmed and removed. However, soil that extended beneath the roadways and beyond the block and groundwater contamination that extended below the top of the shallow groundwater table was not removed, and the extent of contamination was not fully characterized. No known cleanup has been conducted on tax lot 400, the site of a large gas holder tank. Soils and groundwater in the area surrounding tax lots 1400 and 400 may have been impacted by the former gas manufacturing plant. Based on the past releases on the site and proximity to the Project Area, this historical release site has potential to impact the Project.

Towne Storage Property, 17 SE 3rd Avenue, was the southern half of Pacific Iron Works, a foundry in the early 1900s, on tax lot 800. This portion of the block is now developed with a four-story brick commercial building. During renovations in 2017, contaminated soil was confirmed and removed. Additional investigation was conducted to determine the extent of contamination. Residual soil and groundwater contamination remain at the site, but below DEQ risk-based concentrations for direct contact under urban residential and occupational exposure scenarios. Soil gas testing completed at the site shows that the residual contamination does not present a risk through vapor intrusion. However, based on the presence of residual contamination, this site has potential to impact the Project.

North Waterfront Park, 100–500 NW Front Avenue, is located along the west bank of the Willamette River. On-site soil and groundwater contamination are associated with several adjacent sites including the Old Town Parking/Helistop Structure and Portland Gas Manufacturing (both detailed below). An environmental audit of the site included a subsurface investigation in 2014 and confirmed contaminated soil and groundwater consisting of gasoline constituents, coal tar residues, and oily soils. Preliminary information suggests that this site may be a construction staging area for the Project. Because of the known contaminated soil and groundwater at the site, and the potential use of the property for construction staging, this site has the potential to impact Project activities.

PDC Block 8L Downtown Waterfront, 60 NW Davis Street, has been redeveloped into a commercial and residential building. The site has completed a VCP (2017) and was issued a conditional NFA letter. Soil and groundwater contamination were confirmed and remediated, and a soil vapor barrier and collection system were installed. Engineering and institutional controls are in place at the site because of the contaminated soil and groundwater that remains, and the site requires ongoing cap inspection and maintenance. Due to known residual contamination on the property (although low), this site has potential to impact the Project if construction activities were to occur near the site.

Old Town Parking/Helistop Structure, 33 NW Davis Street, was a former taxicab company with at least three large USTs installed in the 1950s. The site is also adjacent to the former Portland Gas Manufacturing site, on the south side of the gas site. The City of Portland acquired the site and redeveloped it into a parking garage. Groundwater wells were installed in 1991, and contamination (petroleum hydrocarbons and PAHs)

was confirmed. Because of the known contaminated soil and groundwater at the site, this site has the potential to impact the Project.

Block 15 – Former Portland Gas Manufacturing, 121 NW Everett Street, was part of a former gas manufacturing plant from 1860 to 1906. The site was decoupled from the multi-block Portland Gas Manufacturing cleanup site, has completed a VCP (2014), and was issued a conditional NFA letter. Soil and groundwater contamination were confirmed in direct relation to the gas manufacturing plant, and a soil vapor barrier and collection system were installed. Engineering and institutional controls are in place at the site because of the contaminated soil and groundwater that remains, and the site requires ongoing cap inspection and maintenance. Because of the known contaminated soil and groundwater at the site, this site has the potential to impact the Project.

Portland Gas Manufacturing, bounded by NW Everett, Glisan, 2nd Avenue, and the Willamette River, was a former gas manufacturing plant from 1860 to 1906. The site is part of an ongoing VCP and remediation action plan. Site characterization and source control evaluations have been completed including upland and in-water characterization. A draft final remedial design document was submitted in May 2019, and a revised document is forthcoming. Remedial actions are being planned for 2020 which will include removal of tar and contaminated sediment, capping, and a combination of enhanced and non-enhanced monitored natural recovery (DEQ 2019). Because of the known contaminated soil and groundwater at the site, this site has the potential to impact the Project.

Portland Harbor Superfund Site, Willamette River RM 2 to RM 12. The Portland Harbor site extends from about the Broadway Bridge to Sauvie Island. Portland Harbor has a long history of shipping, industrial, and commercial activity and historical, natural, and cultural significance. Sediments in this stretch of the river are contaminated primarily with DDT,[1] petroleum products (PAHs), and PCBs. The EPA designated Portland Harbor as a Superfund Site in December 2000. Numerous investigations, source control, and cleanup actions have occurred and are ongoing.

Although the Portland Harbor site is located downriver and outside of the API, it is included as a Priority Site in this hazardous materials analysis due to the connection to the Downtown Reach (which is not listed separately in regulatory database files) and the potential for contamination in upriver sediments. Information obtained from DEQ indicates that sediment contamination within the Downtown Reach is likely present (and has been confirmed in many areas). As part of the Portland Harbor investigation activities, as well as some limited independent actions, a number of sediment investigations have been conducted within and near the Downtown Reach, including the area between RM12.1 and 12.5, where the EQRB Project Area is located. DEQ has overseen multiple sediment investigations and five major sediment cleanup actions in the 4-mile Downtown Reach. Although specific sediment data within the API are limited, DEQ and EPA have concluded that concentrations of contaminants in the Downtown Reach are substantially lower than those found in sediments within the Portland Harbor Superfund Site. DEQ expects that concentrations of contaminants in surface sediments in the Downtown Reach will decline over time as the in-water sources are addressed, upland sources are controlled, and natural recovery mechanisms take effect (DEQ 2018).

1 Dichlorodiphenyltrichloroethane

5.3.3 Sanborn Map Review

Sanborn Fire Insurance Maps are historical maps that were developed for many cities from the turn of the twentieth century to the late 1960s to document fire risk. Sanborn maps were reviewed for businesses that would likely have used or stored hazardous materials or petroleum products, or that had other indications of potential subsurface impacts. Examples of these businesses are gasoline/service stations, wrecking yards, machine shops and foundries. Sanborn Fire Insurance Maps were overlaid on the EDR database report to identify historical land occupancy and use which can indicate parcels with potential past contamination. Parcels within the Project Area (construction limits, acquisitions, or construction easements) that at one time were the locations of these types of businesses and that are not otherwise noted in a priority database are listed in Table 9. The Sanborn maps that were reviewed are included in Appendix C. The majority of the sites identified on the Sanborn maps were already identified on priority databases, and the maps were useful in identifying property and building boundaries, as well as gas holder tank locations.

Maps for several timeframes were available.

- **1889** – Sanborn maps were available for the Project Area on the east and west sides of the Willamette River.
- **1901** – Sanborn maps were available for the Project Area on the east and west sides of the Willamette River.
- **1908** – Sanborn maps were available for the Project Area on only the west side of the Willamette River.
- **1909** – Sanborn maps were available for the Project Area on only the east side of the Willamette River.
- **1924** – Sanborn maps were available for the Project Area on only the east side of the Willamette River.
- **1950** – Sanborn maps were available for the Project Area on the east and west sides of the Willamette River.
- **1969** – Sanborn maps were available for the Project Area on the east and west sides of the Willamette River.

Table 9. Sanborn Maps–Identified Priority Sites

Name	Map Address	Source	Site Use	Potential Contaminants
Unknown	NE Corner of E Burnside and E 3rd Street	Sanborn (1924)	Automotive repair	Petroleum including fuels and oils, VOCs
Unknown	SW Corner of E Burnside and E 3rd Street	Sanborn (1924)	Auto and oil storage	Petroleum including fuels and oils, VOCs
Unknown	50 N 2nd Street	Sanborn (1908)	Machine shop	Petroleum including fuels and oils

Note: Sites are in addition to sites already identified through state and federal database searches

5.3.4 Historical Aerial Photograph Review

Historical aerial photographs of the Project Area and API were obtained from EDR. Aerial photographs from 1936 to 2016 were reviewed; these included approximately one or two photographs from each decade (Appendix D).

The current Burnside Bridge was built in 1926, therefore the bridge is visible on every aerial photograph researched. The historical aerial photographs show the development of the dense urban area on the east and west sides of the Willamette River at the approaches of the bridge. On the east side of the bridge, the railroad is present, running under the bridge (north-south). The construction of Interstate 5 is visible under the east side of the Burnside Bridge in the 1960s. During the review of the aerial photographs, no specific sites (other than those identified from other sources) were identified in relation to hazardous materials, hazardous waste, or potential contamination.

5.3.5 City Directories

City directories list the names and addresses of businesses operating in a city. The directories are useful for hazardous materials studies because the name of a business often reveals the type of business it is and therefore the type of chemicals it might have used and possibly released. City directories were obtained from EDR for the following years:

- 1924, 1930, 1935, 1940, 1950, 1955, 1960, 1965, 1967, 1970, 1975, 1977, 1980,1981, and 1985 (R.L. Polk Co. Publishers)
- 1946 (the Pacific Telephone and Telegraph Company)
- 1992 (U.S. West Direct)
- 2005 (Cole Information Services)
- 2010 and 2014 (EDR Digital Archive)

The city directories are included in Appendix E and were reviewed to identify businesses commonly associated with chemical and hazardous materials use, hazardous waste disposal, and potential contamination. No additional sites were identified that are not already listed in other sources reviewed.

5.3.6 Site Reconnaissance

A site reconnaissance was conducted on June 25, 2019, to view properties within the Project Area and adjacent areas. Observations were taken regarding the types of structures observed, land use or property tenants, environmental conditions, and confirmation of hazardous materials (database) site locations. The majority of the Project Area is highly developed urban land consisting of streets, commercial and office buildings, apartment and condominium buildings, and parking lots. One exception is on the west side of the Willamette River; Tom McCall Waterfront Park extends along the seawall. In general, the site reconnaissance did not identify visual evidence suggesting significant potential concerns related to hazardous substances and petroleum products. Evidence of potable water wells was not observed within the Project Area nor through

other available sources. Aboveground storage tanks (ASTs) and evidence of USTs were also not observed within or near the Project Area.

One active gasoline station was observed outside of the Project Area, within the API, located at 400 W Burnside. Three UST access ports were observed on site, and no monitoring wells were observed. The gas station has two records of leaking petroleum storage tanks (at the same address, under a different name); one cleanup was completed and closed in 1994 and the other in 2004. This site is not expected to be affected by construction activities and thus presents low environmental risk to the Project.

6 Impact Assessment Methodology and Data Sources

The hazardous materials evaluation considered known sites on, adjacent to, or near the Project Area, with an emphasis on properties to be acquired, if any, and the potential for human or environmental impacts should they be affected by construction. The current status of regulatory and cleanup actions was also considered. The evaluation reflects the type of contamination and the media contaminated, then applies professional judgment to assess the level of concern that contamination may pose for a potential acquisition property, including the level of cost and difficulty in cleanup. The potential that contamination may have migrated or could still migrate to other properties, such as through groundwater, was also evaluated. Data sources consulted are described in Sections 1.1 and 5.3.

The following were considered to help determine impacts of high concern:

- Would Project operation pose a risk to human health or the environment by exposing hazardous substances that may not be managed using standard best management practices?
- Would Project construction activities expose or exacerbate contamination, posing a risk to human health or the environment? This evaluation relied on applicable state or federal standards and an assessment of exposure pathways and potential receptors.
- If it is necessary to acquire hazardous materials sites to build the Project, what sites pose the highest concerns for cleanup, potential Project delays, or increased exposure to people or the environment?
- Does one or more Project Alternatives or a potential design option provide an opportunity to avoid or minimize the above risks?

6.1 Long-Term Impact Assessment Methods

The evaluation of direct long-term impacts generally includes the need to conduct or maintain remedial actions to address contaminated materials that may remain on an existing contaminated site after construction is complete. In many cases, these could result in long-term beneficial effects (construction within a contaminated site typically requires remedial actions to remove or manage contaminated materials, which promotes an overall long-term beneficial effect). Long-term remedial actions could include deed

restrictions, engineering controls, or placement of soil caps, groundwater treatment systems, or similar technologies and approach. In any case, it is in the best interest of the Project and the environment to identify contaminated sites prior to construction, and either avoid them or determine appropriate courses of action prior to acquisition. The analysis of long-term impacts also covers the use of and policies for managing hazardous materials in the operation and maintenance of the new facility.

6.2 Short-Term Impact Assessment Methods

This assessment evaluates the direct short-term impacts from hazardous materials that could arise during construction. Short-term impacts are typically associated with the following risks:

- Leakage or a spill associated with construction activities, equipment, and materials including fuel, lubricants, and other hazardous substances.
- Exposure to or migration of contaminants encountered in soil or groundwater during construction.
- Exposure to hazardous materials in the event of demolition of buildings or structures, including lead-based paint, asbestos-containing materials, and other hazardous substances.

6.3 Indirect Impact Assessment Methods

Indirect impacts occur later in time (after Project completion) or are farther removed in distance but are still reasonably foreseeable in the future. Indirect Project-related impacts from hazardous materials might arise during future Project operation. Examples of indirect effects include hazardous material leaks and spills by commercial and freight haulers crossing the bridge or other nearby facilities. Some of these effects could be beneficial, such as an earthquake-resilient structure that could reduce vehicle accidents, leaks, and spills during an earthquake event. The evaluation and discussion of indirect impacts below is qualitative.

6.4 Cumulative Impact Assessment Methods

The cumulative impacts analysis considers the Project's impacts combined with other past, present, and reasonably foreseeable future actions that would have environmental impacts in the Project vicinity. Based on the list of foreseeable transportation and other development projects that are anticipated to occur in the Project vicinity within the same time frame, as well as relevant past actions that have defined the Project vicinity, a qualitative analysis examines potential cumulative effects for hazardous materials impacts. The analysis of potential cumulative hazardous materials impacts examines both near-term construction effects, as well as long-term operational impacts. Cumulative impacts are qualitatively assessed, but include known locations, types of issues or effects, and the types of environmental resources potentially affected, including groundwater, surface water, land use, and/or other sensitive resources.

7 Environmental Consequences

7.1 Introduction

The description of long-term impacts (Sections 7.2 and 7.3) is divided into (1) pre-earthquake impacts, based on each Alternative's footprint and its day-to-day operations, as well as (2) impacts that would occur after a CSZ earthquake, including how each Alternative affects resiliency, emergency response and longer-term recovery.

Short-term impacts (Section 7.4) are primarily associated with construction-related activities, including the Build Alternatives without a temporary bridge and those utilizing a temporary bridge.

7.2 Pre-Earthquake Impacts

With respect to hazardous materials, long-term impacts could occur in three general categories: (1) property acquisition, (2) effects to the environment from operation, and (3) effects to operation from hazardous materials. These potential impacts are assessed qualitatively for each Alternative based on the current understanding of the natural and built environments.

To support the assessment of impacts, the potential acquisition properties were identified for each of the Alternatives. These are shown on Figure 6 through Figure 9, and include the location of previously identified priority hazardous materials sites. Table 10 includes the number of full and partial acquisitions for each Alternative and the number of priority hazardous materials sites that are associated with the acquisitions.

Table 10. Acquisitions and Hazardous Materials Site by Alternative

Alternative	Full	Partial	Hazardous Materials Sites
No-Build Alternative	0	0	0
Retrofit Alternative	6	2	0
Short-Span Alternative	6	2	0
Long-Span Alternative	6	2	0
Couch Extension	8	4	0
Temporary Bridge	+0	+0	0

Short-term impacts (construction impacts) associated with property acquisition are discussed in Section 7.4. Long-term impacts associated with property acquisition are included in the following sections.

Figure 6. Displacements – Retrofit Alternative

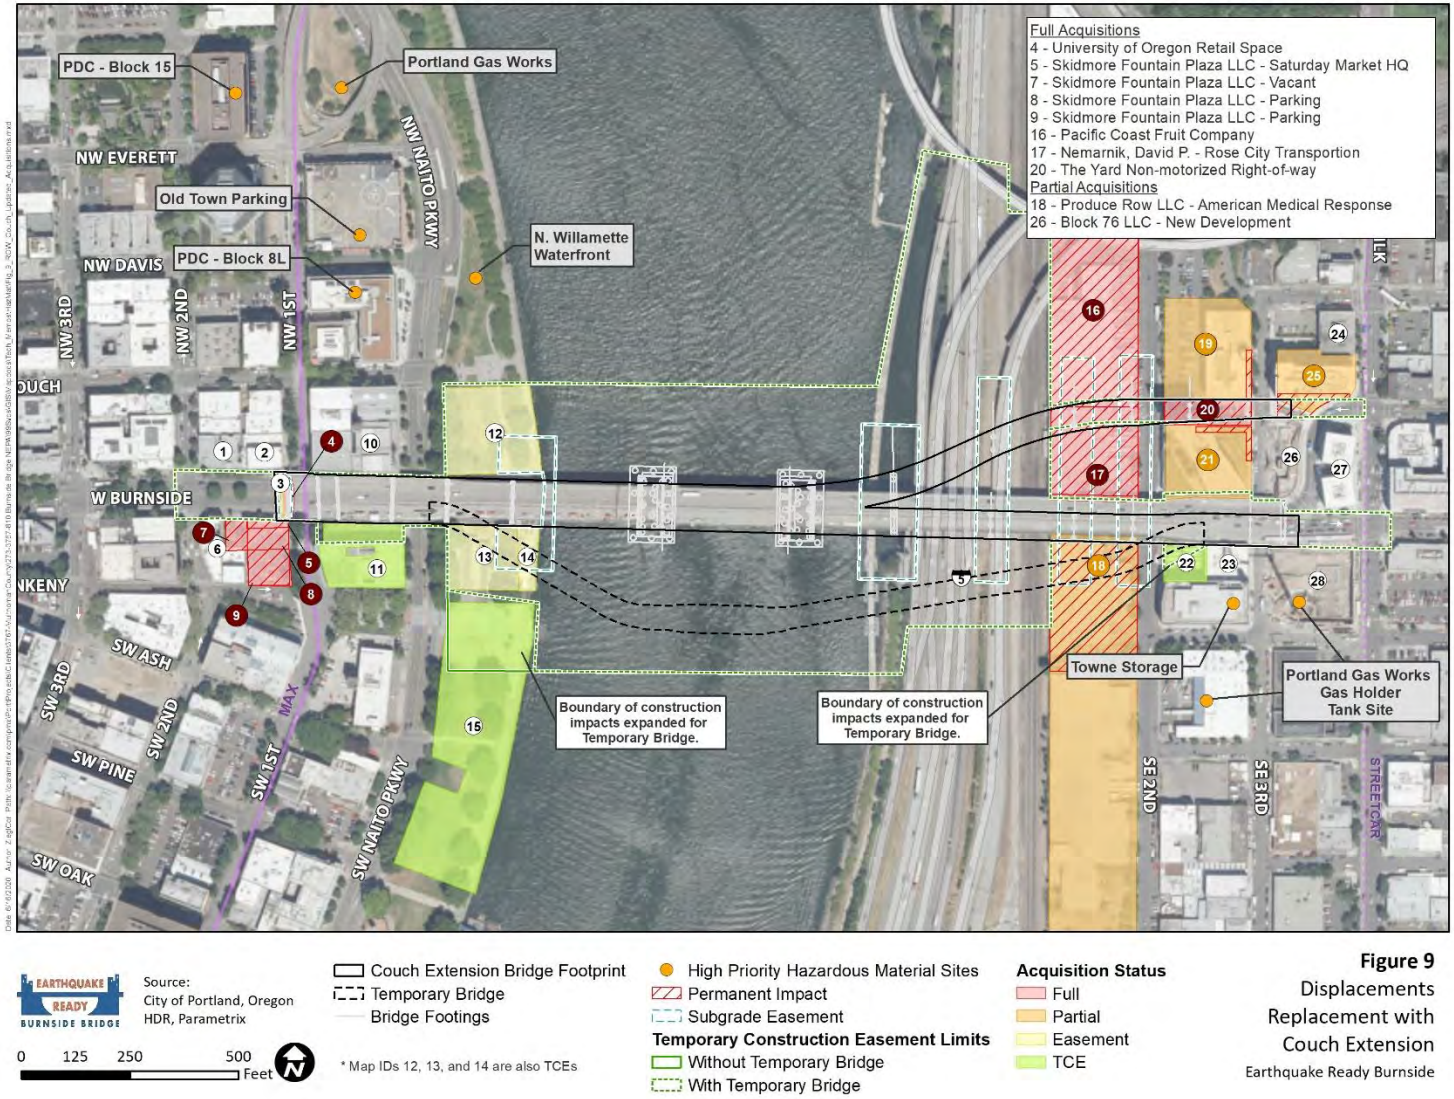
Figure 9. Displacements – Couch Extension Alternative



Source: City of Portland, Oregon, HDR, Parametrix

7.2.1 No-Build Alternative

Hazardous materials contamination in the soil, sediment, and/or groundwater throughout the Project Area would not be disturbed for construction of a bridge under the No-Build Alternative; therefore, it would not be different from existing conditions. The existing contamination would remain in place except where active cleanup operations are underway (and unrelated to the EQRB Project). There is some potential that future maintenance in the Project footprint could be negatively affected due to the lack of cleanup that may be associated with implementation of the EQRB Project construction.

Operation of the existing roadway under the No-Build Alternative may result in the release of hazardous substances or petroleum products into the environment from accidental spills. These releases can migrate to surface water, soil, or groundwater and can affect properties outside of the right-of-way. Adverse effects include road closures and delays, cleanup costs, and regulatory fines applied to the responsible party.

7.2.2 Enhanced Seismic Retrofit Alternative

Potential direct and indirect impacts for the Retrofit Alternative are summarized below.

Direct

Long-term impacts (post-construction) can occur where hazardous materials might remain present on properties acquired for the Project and could potentially impact humans and/or the environment after the Project is constructed. Some of the activities involved, such as ongoing cleanup and remediation on previously contaminated sites, could extend beyond Project completion. As shown on Figure 6, no priority hazardous materials sites were identified that may be acquired as part of the Retrofit Alternative. However, two hazardous materials sites (Towne Storage and Portland Gas Works Gas Holder tank site) are very near temporary construction easements and may be impacted by ground improvements. Subsequent cleanup and remediation, if necessary, would be considered a benefit of the Project.

There is also potential that legacy sites are impacted by the Alternative. Legacy sites are hazardous materials sites that are or should be undergoing long-term cleanup actions by the owner, where additional investigation and cleanup may be required but where the responsible party has not yet complied or are orphan sites which are being managed by regulatory agencies. These activities could potentially interfere with the long-term operation and maintenance of the Alternative and result in financial liability or access restrictions. Based on a review of priority hazardous materials sites and the Project footprint, two legacy hazardous materials sites (Towne Storage and Portland Gas Works Gas Holder tank site) were identified near the Retrofit Alternative footprint.

Operation of the Retrofit Alternative above ground and its roadway elements is not expected to affect existing hazardous materials in the soil and/or groundwater. However, the operation of new facilities installed underground, such as utilities, could have impacts on future cleanup efforts. New pipelines, duct banks, or conduits could physically impede the cleanup of soil or groundwater, requiring that either the contamination be left in place or that the cleanup operation take extra measures to protect and support the utilities. It is

expected that some utility work would be required on the approach areas of the Alternative.

Potential adverse impacts due to existing sediment contamination were also identified. The Retrofit Alternative includes reconstruction of the piers and encasing them in concrete; the locations of the piers would not be altered. In the absence of mitigation, in-water work activities such as pier reconstruction, could negatively impact surface water conditions through release of contaminated sediment in the work area, and downriver sediment quality may also be impacted through re-deposition (although both of these may be considered short-term or construction impacts). Long-term impacts from sediments could occur through releases of contaminants due to scouring and changes in river dynamics associated with the reconstructed piers.

Stormwater quality can be diminished by runoff over roadways and bridges carrying automobiles. Typical stormwater pollutants include petroleum products, metals (copper, cadmium, and lead), salts, and suspended solids. Contaminants in stormwater can migrate to surface water, groundwater, and sediments. Long-term operation and maintenance of a stormwater conveyance system and treatment facilities is necessary to meet discharge and water quality regulatory standards. Long-term evaluation of the effectiveness and performance of the treatment systems would be conducted to ensure that the systems are functioning as intended. Additional information can be found in the EQRB Stormwater Technical Report (Multnomah County 2021d).

Indirect

Operation of the roadway under the Retrofit Alternative may result in the release of hazardous substances or petroleum products into the environment from accidental spills, similar to those described for the No-Build Alternative in Section 7.2.1. This is a typical risk associated with roadways and would not be increased by the Retrofit Alternative. The Retrofit Alternative is not expected to substantially improve traffic operations compared to the No-Build Alternative, thus the impacts from accidents and spills are not expected to be significantly different. The potential for spills can be reduced through the development of emergency response plans and best management practices (BMPs), which could be incorporated as part of the Project (see Section 8). No significant long-term indirect effects are anticipated.

7.2.3 Replacement Alternative with Short-Span Approach

Long-term impacts for the Short-span Alternative are summarized below. It should be noted that due to the footprint being similar to that of the Retrofit Alternative, the long-term impacts related to hazardous materials are not significantly different. However, it is expected that ground improvements may be required over a larger area for the Short-span Alternative, particularly at the east end of the structure. Any differences in impacts are outlined below.

Direct

As shown on Figure 7, no priority hazardous materials sites would be acquired as part of the Short-span Alternative. The potential negative and beneficial impacts are primarily the same as those described for the Retrofit Alternative. However, due to the expectation

of ground improvements being required over a larger area for the Short-span Alternative, impacts associated with encountering hazardous materials in the subsurface during construction (including at unknown or legacy sites) are expected to be higher for this Alternative. Two hazardous materials sites (Towne Storage and Portland Gas Works Gas Holder tank site) are very near temporary construction easements and may be impacted by ground improvements. The Short-span Alternative is expected to have more significant ground improvements near these hazardous materials sites than the Long-span Alternative (see Section 7.2.4 below).

There is the potential that legacy sites would be impacted by the Short-span Alternative. Legacy sites are hazardous materials sites that are or should be undergoing long-term cleanup actions by the owner, where additional investigation and cleanup may be required but where the responsible party has not yet complied, or are orphan sites which are being managed by regulatory agencies. These activities could potentially interfere with the long-term operation and maintenance of the Alternative and result in financial liability or access restrictions. Based on a review of priority hazardous materials sites and the Project footprint, Short-span Alternative–related construction would occur in the vicinity of two identified sites (Towne Storage and Portland Gas Works Gas Holder Tank site; see Figure 7). The risk of impact for legacy sites is higher for this Alternative than for the Retrofit Alternative due to the additional necessary ground improvements.

Operation of this Alternative above ground and its roadway elements is not expected to affect existing hazardous materials in the soil and/or groundwater. However, the operation of new facilities installed underground, such as utilities, could have impacts on future cleanup efforts. New pipelines, duct banks, or conduits could physically impede the cleanup of soil or groundwater, requiring that either the contamination be left in place or that the cleanup operation take extra measures to protect and support the utilities. It is expected that the Short-span Alternative would require substantially more new utilities and associated infrastructure that could be impacted as compared to the Retrofit Alternative.

Potential adverse impacts due to existing sediment contamination were also identified. The Short-span Alternative includes construction of in-water piers and bridge footings near the shoreline (see Figure 7). In the absence of mitigation, in-water and near-shoreline work activities could negatively impact surface water conditions and downriver sediment through re-deposition (although these may be considered short-term or construction impacts). Long-term impacts from sediments could occur through releases of contaminants due to scouring and changes in river dynamics associated with the constructed piers. Scouring is further discussed in the EQRB Hydraulic Impact Analysis Technical Report (Multnomah County 2021c).

Stormwater quality can be diminished by runoff over roadways and bridges carrying automobiles. Long-term operation and maintenance of a stormwater conveyance system and treatment facilities is necessary to meet discharge and water quality regulatory standards. Long-term evaluation of the effectiveness and performance of the treatment systems would be conducted to ensure that the systems are functioning as intended. Presumably, the Short-span Alternative has the potential to provide a beneficial effect due to a potential for higher level of stormwater control and treatment through design, installation, and construction of new facilities. Additional information can be found in the EQRB Stormwater Technical Report (Multnomah County 2021d).

Indirect

Indirect impacts are similar to those described for the Retrofit Alternative.

Operation of the roadway under the Short-span Alternative may result in the release of hazardous substances or petroleum products into the environment from accidental spills, similar to those described for the No-Build Alternative in Section 7.2.1. The potential impacts are expected to be the same as those for the Retrofit Alternative. The potential for spills can be reduced through the development of emergency response plans and BMPs, which could be incorporated as part of the Project (see Section 8). No significant long-term indirect effects are anticipated.

7.2.4 Replacement Alternative with Long-Span Approach

Long-term impacts for the Long-span Alternative are summarized below. It should be noted that due to the footprint being similar to that of the Retrofit and Short-span Alternatives, the long-term impacts related to hazardous materials are not substantially different. Any differences in impacts are outlined below. The Long-span Alternative is not materially different from the Short-span Alternative in consideration of hazardous materials impacts, with the exception of additional ground improvements at the west side of the structure for the Short-span Alternative.

Direct

As shown on Figure 8, no priority hazardous materials sites would be acquired as part of the Long-span Alternative. The potential negative and beneficial impacts are primarily the same as those described for the Retrofit Alternative. However, due to the expectation of ground improvements being required over a larger area for the Short-span Alternative, impacts associated with encountering hazardous materials in the subsurface during construction (including at unknown or legacy sites) are expected to be slightly lower for the Long-span Alternative. Two hazardous materials sites (Towne Storage and Portland Gas Works Gas Holder tank site) are very near temporary construction easements and may be impacted by ground improvements. The Long-span Alternative is expected to have fewer ground improvements near these hazardous materials sites than the Short-span Alternative.

There is the potential that legacy sites would be impacted by the Long-span Alternative. Based on a review of priority hazardous materials sites and the Project footprint, Long-span Alternative–related construction would occur in the vicinity of two identified sites (Towne Storage and Portland Gas Works Gas Holder Tank site, see Figure 8). The risk of impact for legacy sites is higher for this Alternative than for the Retrofit Alternative due to the additional necessary ground improvements, but slightly less than for the Short-span Alternative.

Operation of this Alternative above ground and its roadway elements is not expected to affect existing hazardous materials in the soil and/or groundwater. However, the operation of new facilities installed underground, such as utilities, could have impacts on future cleanup efforts. New pipelines, duct banks, or conduits could physically impede the cleanup of soil or groundwater, requiring that either the contamination be left in place or that the cleanup operation take extra measures to protect and support the utilities. It is expected that the Long-span Alternative would require substantially more new utilities

and associated infrastructure that could be impacted as compared to the Retrofit Alternative, but slightly less than for the Short-span Alternative.

Potential adverse impacts due to existing sediment contamination were also identified. The Long-span Alternative includes construction of in-water piers and bridge footings near the shoreline (see Figure 8). In the absence of mitigation, in-water and near-shoreline work activities could negatively impact surface water conditions and downriver sediment through re-deposition (although these may be considered short-term or construction impacts). Long-term impacts from sediments could occur through releases of contaminants due to scouring and changes in river dynamics associated with the constructed piers. Scouring is further discussed in the EQRB Hydraulic Impact Analysis Technical Report (Multnomah County 2021c).

Stormwater quality can be diminished by runoff over roadways and bridges that carry automobiles. Long-term operation and maintenance of a stormwater conveyance system and treatment facilities is necessary to meet discharge and water quality regulatory standards. Long-term evaluation of the effectiveness and performance of the treatment systems would be conducted to ensure that the systems are functioning as intended. Presumably, the Long-span Alternative has the potential to provide a beneficial effect due to a potential for higher level of stormwater control and treatment through design, installation, and construction of new facilities. Additional information can be found in the EQRB Stormwater Technical Report (Multnomah County 2021d).

Indirect

Indirect impacts are similar to those described for the Retrofit Alternative.

Operation of the roadway under the Long-span Alternative may result in the release of hazardous substances or petroleum products into the environment from accidental spills, similar to those described for the No-Build Alternative in Section 7.2.1. The potential impacts are expected to be the same as those for the Retrofit Alternative, Short-span Alternative, and Couch Extension. The potential for spills can be reduced through the development of emergency response plans and BMPs, which could be incorporated as part of the Project (see Section 8). No significant long-term indirect effects are anticipated.

7.2.5 Replacement Alternative with Couch Extension

Long-term impacts for the Couch Extension are summarized below. However, it should be noted that impacts related to hazardous materials are not significantly different than for the Short-span or Long-span Alternatives described in Sections 7.2.3 and 7.2.4.

Direct

As shown on Figure 9, no priority hazardous materials sites are expected to be acquired as part of the Couch Extension Alternative. The potential negative and beneficial impacts are the same as those described for the other Build Alternatives. No priority hazardous materials sites are expected to be acquired as part of the additional acquisition for the Couch Extension.

There is the potential that legacy sites are impacted by the Alternative. Based on a review of priority hazardous materials sites and the Project footprint, no existing legacy hazardous materials sites were identified for this Alternative. However, Project construction would occur in the vicinity of two identified sites (Towne Storage and Portland Gas Works Gas Holder Tank site, see Figure 9. Also, with additional acquisition required, as well as a larger construction footprint, this Alternative has a greater risk of encountering unknown or legacy sites.

Operation of the Alternative above ground and its roadway elements is not expected to affect existing hazardous materials in the soil and/or groundwater. However, the operation of new facilities installed underground, such as utilities, could have impacts on future cleanup efforts. New pipelines, duct banks, or conduits could physically impede the cleanup of soil or groundwater, requiring that either the contamination be left in place or that the cleanup operation take extra measures to protect and support the utilities. It is expected that the Couch Extension Alternative would require substantially more new utilities and associated infrastructure that could be impacted as compared to the Short-span and Long-span Alternatives.

Potential adverse impacts due to existing sediment contamination were also identified. However, in-water work activities are not significantly different than those described for the Short-span and Long-span Alternatives; thus, the potential long-term impacts are similar.

Indirect

Indirect impacts are similar to those described for the Short-span and Long-span Alternatives. However, impacts due to operation (such as spills/accidents) and stormwater quality may be beneficially affected due to a larger footprint and the development of new facilities and traffic improvements associated with this Alternative.

7.3 Post-Earthquake Impacts

Post-earthquake impacts are evaluated below for each of the Alternatives. However, it should be noted that in general, hazardous materials impacts on the Build Alternatives or Build Alternative impacts on hazardous materials do not appear to be materially different than those described for pre-earthquake conditions. Therefore, the previously described impacts are not re-iterated below and only potential adverse or beneficial impacts that are different from pre-earthquake conditions are noted, where applicable.

7.3.1 No-Build Alternative

No significantly different impacts associated with the No-Build Alternative were identified for post-earthquake conditions. Under the assumption that the existing structure would fail during a CSZ earthquake, direct impacts associated with the failed structure could be realized. This includes adverse impacts associated with materials from the existing bridge, roadway, and associated structures entering the river and shoreline areas. Materials containing lead-based paint, asbestos, or other hazardous substances could create significant adverse impacts if uncontrolled releases occur.

In addition, there is potential that spills associated with vehicles on the roadway during the CSZ event could adversely impact surface water, soil, or groundwater. Materials released from structures and/or vehicles would need to be cleaned up accordingly, and could have significant impact on cost, timing, and available resources.

7.3.2 Enhanced Seismic Retrofit Alternative

No significantly different impacts associated with the Retrofit Alternative were identified for post-earthquake conditions. However, there would be a potential benefit to this Alternative in comparison to the No-Build Alternative related to having an earthquake-ready structure in place. The retrofitted structure could minimize the release of hazardous materials that would be associated with a failed bridge structure. The retrofitted bridge could also reduce potential vehicle accidents, leaks, and spills during an earthquake event, as compared to those that could occur under the No-Build Alternative.

7.3.3 Replacement Alternative with Short-Span Approach

No significantly different impacts associated with the Short-span Alternative were identified for post-earthquake conditions. However, there would be a potential benefit to this Alternative in comparison to the No-Build Alternative related to having an earthquake-ready structure in place. The new structure could minimize the release of hazardous materials that would be associated with a failed bridge structure. The new bridge could also reduce potential vehicle accidents, leaks, and spills during an earthquake event, as compared to those that could occur under the No-Build Alternative.

7.3.4 Replacement Alternative with Long-Span Approach

No significantly different impacts associated with the Long-span Alternative were identified for post-earthquake conditions. However, there would be a potential benefit to this Alternative in comparison to the No-Build Alternative related to having an earthquake-ready structure in place. The new structure could minimize the release of hazardous materials that would be associated with a failed bridge structure. The new bridge could also reduce potential vehicle accidents, leaks, and spills during an earthquake event, as compared to those that could occur under the No-Build Alternative.

7.3.5 Replacement Alternative with Couch Extension

No significantly different impacts associated with the Couch Extension Alternative were identified for post-earthquake conditions. However, there is a benefit of this Alternative in comparison to the No-Build Alternative related to having an earthquake-ready structure in place. The new structure could minimize the release of hazardous materials that would be associated with a failed bridge structure. The new bridge could also reduce potential vehicle accidents, leaks, and spills during an earthquake event, as compared to those that could occur under the No-Build Alternative.

7.4 Construction Impacts

This section discusses the potential construction impacts of the Project. The analysis of construction impacts is based on the current understanding of existing conditions

described in Section 5 and anticipated construction methods and Project footprint. The construction impacts are assessed for the Alternatives considering two different conditions: (1) construction without a temporary bridge, and (2) construction with a temporary bridge.

7.4.1 Without Temporary Bridge

Three general categories of construction impacts are examined: (1) liability to the purchaser in acquiring property, (2) effects on the environment and resources from construction in areas where hazardous materials exist, and (3) effects on construction from hazardous materials.

To support assessment of impacts for each of the Alternatives, the potential acquisition properties were identified. Table 11 includes the number of full and partial acquisitions for each Alternative.

Table 11. Acquisitions by Alternative

Alternative	Full	Partial
No-Build Alternative	0	0
Retrofit Alternative	6	2
Short-Span Alternative	6	2
Long-Span Alternative	6	2
Couch Extension	8	4
Temporary Bridge	+0	+0

Enhanced Seismic Retrofit Alternative

Property Acquisition Liability for Temporary Structure

Tax lots that have been identified for potential acquisition are included on Figure 6. As shown in Table 11, six full and two partial acquisition would be required for the Retrofit Alternative.

Acquisition of property where RECs have been identified can result in potential liability for the purchaser. In Oregon, the standard for liability for remedial actions (cleanup) of a property is pursuant to Oregon Revised Statute (ORS) 465.255. This statute states that “the owner/operator is strictly liable for those remedial action costs incurred by the state or any other person that are attributable to or associated with a facility and for damages for injury to or destruction of any natural resources caused by a release.” This statute extends to limit the State’s legal liability of an acquired facility or property through condemnation.

Liability issues can include (1) restriction in current or future property use; (2) incurring costs for cleanup; (3) schedule delays; (4) worker and public safety; and (5) increased resource agency oversight. Conducting *all appropriate inquiries* into the previous ownership and uses of the property prior to a property transaction is a means of

safeguarding and managing the potential liability issues. In this way, RECs are disclosed prior to the sale of the property, and potential issues can be mitigated prior to the start of construction activities. Inquiry may result in responsibility for cleanup by the owner/operator and/or reduction in the property's value.

Effects on the Environment from Construction

Environmental media—soils, sediments, surface water, stormwater, and groundwater—can be adversely affected by the exacerbation of existing contamination or the release of hazardous substances during construction activities. Effects from hazardous materials may cause a risk to human health or the environment, raise liability issues, increase Project costs, and/or cause schedule delays.

The degree to which existing contamination can migrate into the environment depends on the type, intensity, and duration of construction activities and the nature and extent of the contamination. Types of construction activities for the Retrofit Alternative could include, but are not limited to, excavation, utility line trenching on approaches, reconstruction or installation of new stormwater infrastructure, reconstruction of piers for bridge and foundations, and focused demolition. The type, intensity, and duration of these activities would be further defined during the design phase and contractor procurement.

Documented contaminants at identified hazardous materials sites within the Project Area include petroleum hydrocarbons and associated compounds and pollutant metals. Unidentified contamination from historical land use likely exists within the Project Area, primarily in the bridge approach areas. Contaminants that are encountered during construction can migrate into the environment along a variety of pathways. Shallow soil contamination can migrate downward into subsurface soils and/or groundwater through drag-down from excavation, utility work, and/or infiltration of stormwater. Groundwater impacts can be exacerbated from dewatering activities. Impacted stormwater can migrate to surface water and sediments.

Sediment contamination is not fully defined in the Project Area, but could include petroleum compounds, metals, pesticides, and other chemicals. Impacted sediments can be re-suspended into the water column and/or re-deposited due to in-water construction activities. The Retrofit Alternative includes the reconstruction of in-water piers and encasing them with concrete. In the absence of mitigation, in-water and near-shoreline work activities could negatively impact surface water conditions and downriver sediment through re-deposition. Over-water activities such as demolition and construction could also adversely affect surface water quality.

Alternatively, hazardous substances or petroleum products have the potential to be released into the environment during construction activities. Construction equipment can release petroleum products into the environment from the improper transfer of fuel or from spills. Other pollutants such as paints, acids for cleaning masonry, solvents, raw concrete, paving, and concrete-curing compounds are present at construction sites and may enter the environment if not managed correctly.

Demolition of structures can also have adverse impacts on the environment. This includes any focused demolition on the bridge and associated structures that may be necessary as part of the Retrofit Alternative. In addition, demolition of structures or

buildings associated with the full acquisition areas should also be considered. The existing bridge and other associated structures that contain lead and/or asbestos-containing materials will need to have proper abatement conducted prior to any demolition, renovation, or repair activities. Wastes that contain lead and asbestos-containing materials are managed and disposed of as non-hazardous wastes under 40 CFR Part 261. Abatement must follow state guidelines and be conducted by licensed abatement firms. Abatement materials must be properly disposed of at authorized solid waste facilities. Lead has the potential to be a hazardous waste if it fails the Toxicity Characteristic Leaching Procedure (EPA 1992). Asbestos is treated as an industrial waste and requires special packaging and handling pursuant OAR 340-248, WAC 269-65, and 40 CFR Part 61 Subpart M. It should be noted that abatement of hazardous materials can be considered a beneficial impact as it removes the material and properly contains and isolates it accordingly through appropriate disposal.

Potential Effects on Construction Activities

Adverse effects to worker safety and public health from hazardous materials during construction can occur if not correctly mitigated. Potential exposure routes include dermal contact and ingestion of contaminated soil and water and inhalation of contaminated vapors or particulates. Exposure is typically greatest during excavation work, demolition, or application of materials that contain hazardous substances. Potential receptors include construction workers, excavation workers, and the traveling public. Health effects depend on the type of contaminants, duration, dosage, exposure route, and age of those exposed.

Waste can be generated during construction activities when contaminated materials are encountered or generated by construction and demolition. Waste can consist of contaminated soils, sediments, water, and/or building materials.

Non-hazardous wastes are those categorized as not hazardous waste and are exempted from or do not apply to Resource Conservation Recovery Act (RCRA) Subtitle C regulations. They are typically called “solid waste.” Non-hazardous wastes likely to be encountered are fill, debris, soil, wood, and lead-based paint associated with bridge structures. Non-hazardous wastes require management in accordance with applicable federal and state regulations. Characterizing, managing, storing, and disposing of non-hazardous waste would likely be a common component of Project construction.

A solid waste that is dangerous and/or potentially harmful to human health is considered a hazardous waste. Hazardous waste can have characteristics of toxicity, corrosivity, reactivity, and/or ignitability that are governed by RCRA Subtitle C regulations. Universal wastes include batteries, pesticides, and mercury-containing light bulbs. In addition, wastes that contain PCBs are managed under the Toxic Substance Control Act (TSCA) and under 40 CFR Part 761. Characterizing, managing, storing, and disposing of hazardous waste would likely be a small component of Project construction, but could be present in buildings or structures slated for demolition. However, if not mitigated correctly, hazardous wastes can increase Project costs and cause schedule delays and are a source of liability to the Project.

Replacement Alternative with Short-Span Approach

Tax lots that have been identified for potential acquisition are included on Figure 7. As shown in Table 11, six full and two partial acquisitions would be required for the Short-span Alternative. Construction impacts from the Short-span Alternative are not significantly different than those described for the Retrofit Alternative.

However, it should be noted that the presumed demolition of the existing bridge and associated structures could have a significant impact, particularly on the management of both non-hazardous and hazardous waste. Mitigation of any potential environmental impacts would require appropriate permitting, planning, management, and proper disposal. Over-water activities such as demolition and construction could also adversely affect surface water quality if not managed properly.

Short-term impacts associated with sediment contamination could also be different than those for the Retrofit Alternative. The Short-span Alternative includes construction of in-water piers and bridge footings near the shoreline (see Figure 7). In the absence of mitigation, in-water and near-shoreline work activities could negatively impact surface water conditions and downriver sediment through re-deposition. There would be significantly more in-water work activities for this Alternative due to the removal of the existing piers and construction of new piers and bridge footings, which has the potential for impacting larger areas of river sediment.

Replacement Alternative with Long-Span Approach

Tax lots that have been identified for potential acquisition are included on Figure 8. As shown in Table 11, six full and two partial acquisitions would be required for the Long-span Alternative. Construction impacts from the Long-span Alternative are not significantly different than those described for the Retrofit Alternative.

However, it should be noted that the presumed demolition of the existing bridge and associated structures could have a major impact, particularly on the management of both non-hazardous and hazardous waste. Mitigation of any potential environmental impacts would require appropriate permitting, planning, management, and proper disposal. Over-water activities such as demolition and construction could also adversely affect surface water quality if not managed properly.

Short-term impacts associated with sediment contamination could also be different than those for both the Retrofit Alternative and Short-span Alternative. The Long-span Alternative includes construction of in-water piers and bridge footings near the shoreline (see Figure 8), but are less than required for the Short-span Alternative. In the absence of mitigation, in-water and near-shoreline work activities could negatively impact surface water conditions and downriver sediment through re-deposition. There would be significantly more in-water work activities for this Alternative than described for the Retrofit Alternative due to the removal of the existing piers and construction of new piers and bridge footings, which has the potential for impacting larger areas of river sediment. However, the impacts are less than those expected for the Short-span Alternative due to less piers and potentially less in-water work.

Replacement Alternative with Couch Extension

Construction impacts from the Couch Extension Alternative are not significantly different than those described for the Short-span and Long-span Alternatives.

However, as shown in Figure 9 and Table 11, the addition of the Couch Extension would require acquisition of additional property in the form of eight full and four partial acquisitions. The higher level of acquisition provides some higher risk of acquisition liability as described above. None of the potentially acquired properties was identified on any of the regulatory databases reviewed.

7.4.2 With Temporary Bridge

Construction impacts associated with all the Build Alternatives with the temporary bridge are similar to those described for the Alternatives without a temporary bridge. Additional impacts or benefits associated with hazardous materials from the addition of a temporary bridge are discussed below.

Enhanced Seismic Retrofit Alternative

Construction impacts associated with the Retrofit Alternative with a temporary bridge are similar to those described for the Alternative without a temporary bridge.

The primary difference in potential construction impacts is associated with in-water work activities and sediment contamination. It is expected that significantly higher in-water work activities would be required for the placement and construction of the temporary bridge and associated coffer dam. In the absence of mitigation, in-water and near-shoreline work activities could adversely impact surface water conditions and downriver sediment through re-deposition. Based on preliminary design, removal of large amounts of river sediments could be necessary as part of construction, and the sediments would need to be handled, managed, and disposed.

Replacement Alternative with Short-Span Approach

Construction impacts associated with the Short-span Alternative with a temporary bridge are similar to those described for the Alternative without a temporary bridge.

The primary difference in potential construction impacts is associated with in-water work activities and sediment contamination. It is expected that significantly higher in-water work activities would be required for the placement and construction of the temporary bridge and associated coffer dam. In the absence of mitigation, in-water and near-shoreline work activities could negatively impact surface water conditions and downriver sediment through re-deposition. Over-water activities such as construction could also adversely affect surface water quality and would be expected to be higher with this Alternative. Removal of major amounts of river sediments could be necessary as part of construction, and the sediments would need to be handled, managed, and disposed. Based on preliminary design, the Short-span Alternative could require a larger volume of sediment removal than for the Retrofit Alternative and Long-span Alternative, but less than for the Couch Extension.

Replacement Alternative with Long-Span Approach

Construction impacts associated with the Long-span Alternative with the Temporary Detour Bridge Option are similar to those described for the Alternative without a temporary bridge.

The primary difference in potential construction impacts is associated with in-water work activities and sediment contamination. It is expected that significantly higher in-water work activities would be required for the placement and construction of the temporary bridge and associated coffer dam. In the absence of mitigation, in-water and near-shoreline work activities could negatively impact surface water conditions and downriver sediment through re-deposition. Over-water activities such as construction could also adversely affect surface water quality and would be expected to be higher with this Alternative. Removal of significant amounts of river sediments could be necessary as part of construction, and the sediment would need to be handled, managed, and disposed. Based on preliminary design, the Long-span Alternative could require a smaller volume of sediment removal than for the Short-span Alternative and Couch Extension, but a larger volume than expected for the Retrofit Alternative.

Replacement Alternative with Couch Extension

Construction impacts associated with the Couch Extension with a temporary bridge option are similar to those described for the Alternative without a temporary bridge.

The primary difference in potential construction impacts is associated with in-water work activities and sediment contamination. It is expected that significantly higher in-water work activities would be required for the placement and construction of the temporary bridge and associated coffer dam. In the absence of mitigation, in-water and near-shoreline work activities could negatively impact surface water conditions and downriver sediment through re-deposition. Over-water activities such as construction could also adversely affect surface water quality and would be expected to be higher with this Alternative. Removal of significant amounts of river sediments could be necessary as part of construction, and the sediment would need to be handled, managed, and disposed. Based on preliminary design, the potential volume of sediment to be removed may be greater than expected for the Short-span and Long-span Alternatives, as well as for the Retrofit Alternative.

7.4.3 Potential Off-Site Staging Areas

The construction contractor may use one or more off-site staging areas outside the bridge study area to store and and/or assemble materials that would then be transported by barge to the construction site. Off-site staging could occur with any of the Alternatives. Whether, where, and how to use such sites would be the choice of the contractor, and, therefore, the actual site or sites cannot be known at this time. Given this uncertainty, detailed analysis of impacts is not possible at this time. To address this uncertainty, four possible sites have been identified that represent a much broader range of potential sites where off-site staging might occur. While the contractor could choose to use one of these or any other site, it is assumed that because of regulatory and time constraints on the contractor, any site they choose would need to be already developed with road and river access. It is also assumed that the contractor would be responsible for relevant

permitting and/or mitigation that could be required for use of a chosen site. The Draft EIS identifies the types of impacts that could occur from off-site staging, based on the above assumptions. This analysis is not intended to "clear" any specific site, but rather to ensure disclosure of the general types of impacts based on the possible sites.

The four representative sites shown in Figure 10 include:

A Willamette Staging Option off Front Avenue

B USACE Portland Terminal 2

C Willamette Staging Option off Interstate Avenue

D Ross Island Sand and Gravel Site

Based on the four potential sites identified, the types of hazardous materials impacts that could occur from off-site staging could be similar to the short-term construction-related impacts discussed previously in this report. This is primarily related to the use, storage, handling, and transportation of hazardous materials.

Hazardous substances or petroleum products have the potential to be released into the environment during both staging and construction activities, including along roadways via vehicle accidents or into the river environment if barges are used for transport from the staging area to the construction site. Construction equipment can release petroleum products into the environment from the improper transfer of fuel or from spills and would be in use at staging areas. Other pollutants, such as paints, acids for cleaning masonry, solvents, raw concrete, paving, and concrete-curing compounds, are present at both staging areas and construction sites and may enter the environment if not managed correctly.

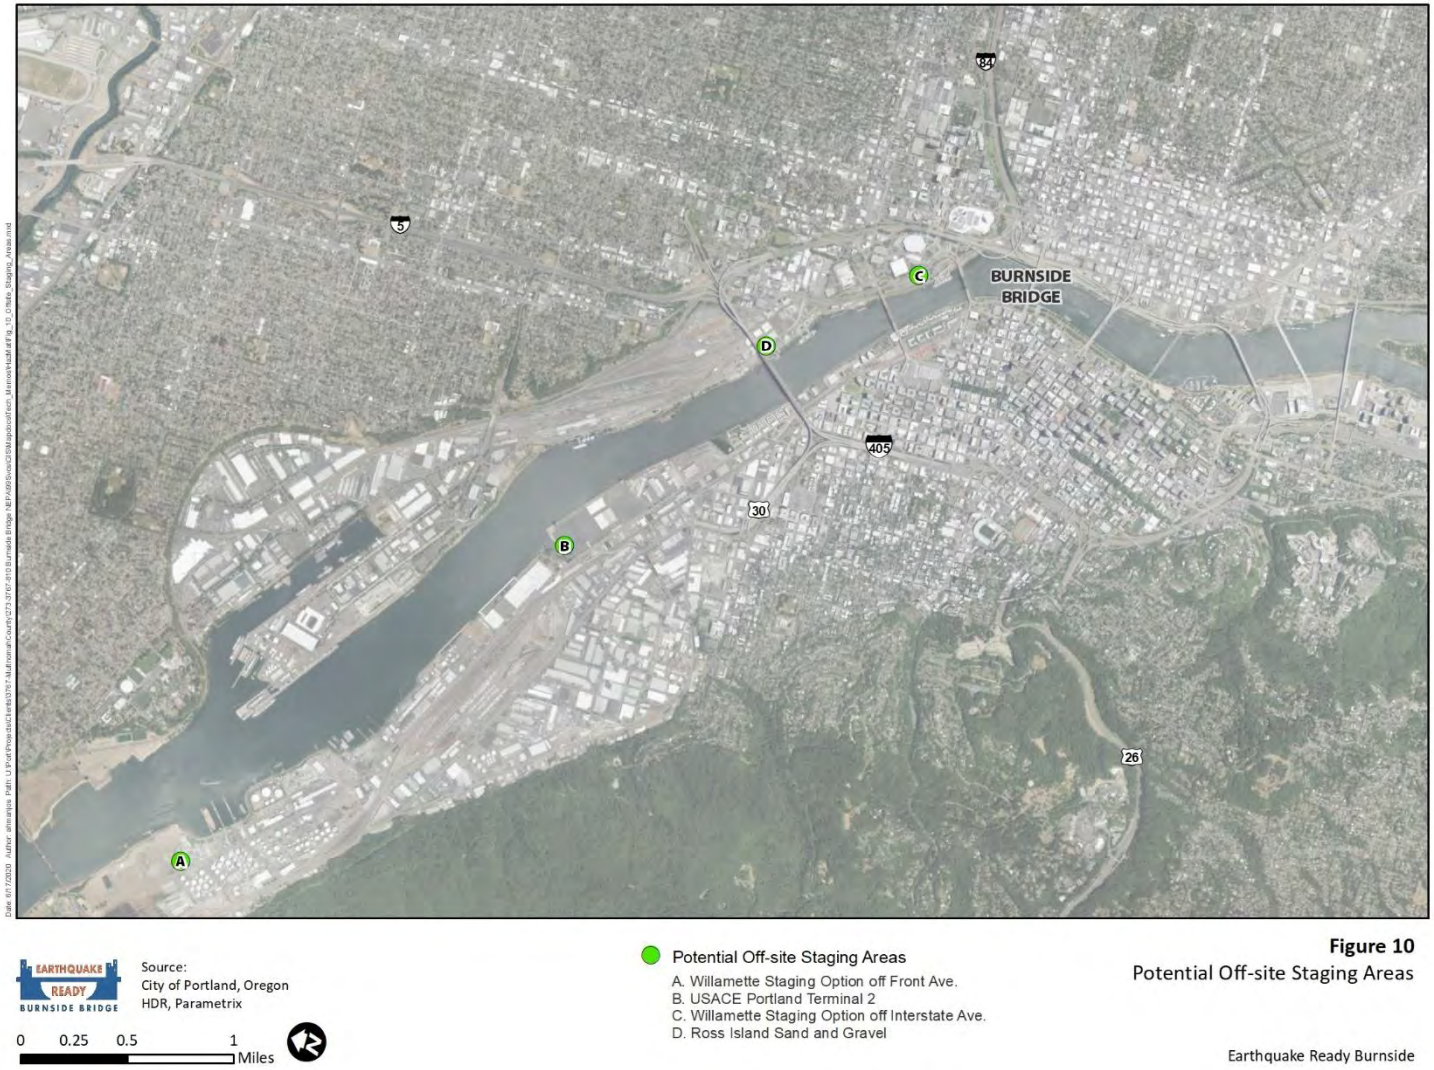
7.5 Cumulative Effects

Cumulative impacts are the accumulation of impacts from past, present, and reasonably foreseeable actions. They are analyzed so that impacts from actions over time that "add up" to affect a resource are considered. The cumulative impacts analysis was performed as described in the EQRB Cumulative Impacts Methodology Memorandum (HDR 2019) for the No-Build and all Build Alternatives.

7.5.1 No-Build Alternative

Hazardous materials contamination in the soil, sediment, and/or groundwater throughout the Project Area would not be disturbed, remediated, or mitigated under the No-Build Alternative; therefore, hazardous materials contamination would not be different from existing conditions and would not contribute to or be impacted by past, present, and reasonably foreseeable actions. Similarly, adverse and/or beneficial effects of Project construction and operation would not be realized; thus, impacts on cumulative effects from reasonably foreseeable actions would not occur as a result of the No-Build Alternative. Based on these impacts, a detailed cumulative effects analysis was not considered necessary for the No-Build Alternative. Cumulative effects on the Build Alternatives are evaluated in the following section.

Figure 10. Potential Off-Site Staging Areas



Source: City of Portland, Oregon, HDR, Parametrix

7.5.2 Build Alternatives

The following cumulative impacts analysis would apply to all Build Alternatives.

Area of Potential Impact

With respect to hazardous materials, the API for evaluation of cumulative impacts is generally the same as that used for direct effects, with the notable exception of including a larger upstream and downstream portion of the Willamette River to account for potential impacts to that resource.

Current Health and Historical Context

As described in Section 5, industrial use near the API began over 100 years ago and has resulted in contamination of various media (air, surface water, sediments, soil and groundwater) with a variety of hazardous materials. Contamination likely peaked in the mid-twentieth century. However, current regulations, passed primarily in the 1970s and 1980s, require that when contaminated media are encountered during construction, the area must be cleaned up or otherwise mitigated to meet minimum standards that are designed to protect human health and the environment. Specific sites with high levels of contamination have also undergone cleanup activities to comply with state and federal regulations. These efforts have resulted in a “checkerboard” of less contaminated areas where cleanup activities have taken place, combined with areas where cleanup has not occurred. Overall, the cleanup efforts have proved to be an incremental benefit to the environment.

Project-Related Construction and Operational Impacts

As described in Section 7, the primary potential for hazardous materials–related operational and construction impacts from the Project include the following:

- Encountering contaminants during roadway, utility maintenance, or other subsurface construction (primarily on the approaches and Couch Extension).
- Spills of hazardous materials due to vehicular accidents or maintenance activities.
- Property acquisition liability
- Structure and/or building demolition and abatement.
- Construction-related spills and releases.
- Disturbance, removal, or exacerbation of contaminated soil, groundwater and sediment during construction.

Current and Reasonably Foreseeable Actions that May Affect Hazardous Materials–Related Conditions

A list of past, present, and reasonably foreseeable future actions was compiled and is presented in the Cumulative Impact Methodology Memorandum (HDR 2019). The actions were reviewed and assessed as to whether the identified projects would have potential impacts on hazardous materials–related conditions in the API. Projects outside the cumulative impact analysis API were not considered.

Impacts on hazardous materials–related conditions from the current or reasonably foreseeable actions can be grouped into two main categories:

- Disturbance, cleanup or removal, and potential exacerbation of existing contaminated soil, groundwater, or sediment during construction and operation.
- Potential for spills or releases during construction or operation.

The projects reviewed from the methodology memo are in various states of planning and design. It is expected that some excavation, removal, or exacerbation could occur as part of construction components during each of these projects.

Cumulative Impacts to Hazardous Materials

A review of the available information suggests that several current and proposed redevelopment projects appear to have construction components that could be in proximity to the EQRB Build Alternatives. These are generally redevelopment projects for mixed-use and commercial properties. This would result in an increased cumulative potential for spills and releases of hazardous materials near the Project footprint during construction and could also add incrementally to the potential that hazardous materials would be encountered in the Project vicinity as development takes place.

Operation of EQRB and the projects identified would likely involve some use and handling of hazardous materials and would be required to comply with hazardous materials laws and regulations. Therefore, these projects would likely implement programs to manage hazardous material handling, use, and disposal, such as spill response plans to address accidental releases. This makes it unlikely that construction of the projects would have a cumulative adverse impact on hazardous material conditions.

Additionally, EQRB and the other projects are likely to improve conditions over the long term due to the removal and disposal of some contaminated soils, groundwater, and/or sediment. As a result, no adverse cumulative impacts to hazardous materials are expected from the operation of EQRB and the other reasonably foreseeable future projects.

It should be noted that the Portland Harbor Superfund Site Remediation was also identified near the Project; it has some potential for cumulative impacts. In general, the cleanup areas are downstream of RM 12, but some of the restoration actions could occur upstream and downstream of the Burnside Bridge location and would have a net beneficial cumulative impact due to cleanup activities. Proper management and planning of the EQRB Project would be necessary to avoid potential adverse impacts to cleanup activities which have occurred or are otherwise planned.

7.6 Compliance with Laws, Regulations, and Standards

This section provides a summary of potential permits and approvals needed for the Project in regard to hazardous materials. Permits and/or approvals may overlap between federal, state and local requirements.

7.6.1 Federal

Federal acts that may pertain to the approval process include:

- The Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) of 1980. 42 USC 9601 et seq.
- The Superfund Amendments and Reauthorization Act of 1986. 42 USC 9601 et seq.
- The Resource Conservation and Recovery Act (RCRA) of 1976. 42 USC 6901 et seq.
- The Toxic Substance Control Act (TSCA) of 1976. 15 USC 2601 et seq.

In addition, the EPA requires a National Pollutant Discharge Elimination System permit for stormwater discharge. It is expected that the Project would be in compliance with all regulations and would obtain all appropriate permits, as necessary.

7.6.2 State of Oregon

ORS and Oregon Administrative Rules (OARs) that may apply to the approval process include:

- Hazardous Waste and Hazardous Materials I and Hazardous Waste and Hazardous Materials II. 2003 ORS 465 and 466, as amended.
- Asbestos Requirements. 2002. OAR 340-248.
- Groundwater Quality Protection. 1998. OAR 340-040.
- Environmental Hazards Notice. 1998. OAR 340-130.
- Hazardous Waste Management System. 2003. OAR 340-100 to 110, 120, 124 and 142.
- Hazardous Substance Remedial Action Rules. 1997. OAR 340-122.
- Water Resource Department. OAR 690-220.

It is expected that the Project would be in compliance with all regulations and would obtain all appropriate permits, as necessary.

7.6.3 City of Portland

The City of Portland requires that all projects conduct permit applications following City of Portland Code (CPC) Title 24.10.070, Application for Permits.

- The City of Portland requires that grading, cut, fill and stockpiling be conducted under CPC Title 24.10 Grading Permit Fees and CPC Title 24.70, Clearing Grading and Erosion Control.
- The City of Portland requires that erosion prevention and sediment control be conducted under CPC Title 10, Erosion and Sediment Control Regulations.
- The City of Portland requires that stormwater be controlled under CPC Title 17.38, Drainage and Water Quality.
- The City of Portland requires that groundwater resources be protected under CPC Title 21.35, Wellhead Protection.

- The City of Portland requires that the handling, storage, use and transportation of hazardous waste be conducted under CPC Title 21.35.

It is expected that the Project would be in compliance with all regulations and would obtain all appropriate permits, as necessary.

7.7 Conclusion

Long-term and short-term (construction) impacts were identified and evaluated. In general, impacts were similar for each of the Build Alternatives, with some variation associated with an increase in infrastructure, increase in Project footprint, or differences in potential construction activities.

Long-term impacts identified for the Build Alternatives include the following:

- Long-term impacts (post-construction) can occur where hazardous materials might remain present on properties acquired for the Project and could potentially impact humans and/or the environment after the Project is constructed. If proper cleanup is implemented, this can have a net beneficial impact for the Project. None of the potentially acquired properties was identified on any of the regulatory databases reviewed.
- Operation of the EQRB above ground and its roadway elements is not expected to affect existing hazardous materials in the soil and/or groundwater. However, the operation of new facilities installed underground, such as utilities, could have impacts on future cleanup efforts. New pipelines, duct banks, or conduits could physically impede cleanup of soil or groundwater, requiring that either the contamination be left in place or that the cleanup operation take extra measures to protect and support the utilities.
- Potential adverse impacts due to existing sediment contamination were also identified. Long-term impacts from sediments could occur through releases of contaminants due to scouring and changes in river dynamics associated with the constructed piers, which has the potential for re-deposition downstream, including within the Portland Harbor Superfund Site, and potential impact on ongoing or completed cleanup activities.
- Operation of the roadway may result in the release of hazardous substances or petroleum products into the environment from accidental spills. The Build Alternatives would not substantially improve traffic operations compared to the No-Build Alternative; thus, the impacts from accidents and spills are not expected to be significantly different among the Build Alternatives or as compared to the No-Build Alternative.
- Stormwater quality can be diminished by runoff over roadways and bridges carrying automobiles. Long-term operation and maintenance of stormwater conveyance systems and treatment facilities is necessary to meet discharge and water quality regulatory standards.

Short-term impacts were identified and are primarily associated with construction-related activities:

- The Project has a potential for adverse effects from property acquisition liability if not correctly mitigated.
- The Project has the potential for adverse effects to the environment from re-exposing contaminated soils, potentially adding to existing contaminated soils or through accidental releases during construction.
- Surface water quality can be adversely affected by near-water or in-water construction activities. Over-water activities such as bridge demolition and construction could also adversely affect surface water quality.
- The Project has a potential for adverse effects to the environment from the mobilization of sediment contamination. Mobilization of existing sediment contamination is of most concern in near-shore environments where pier installation could occur. These construction activities could re-suspend contaminants into the water column, re-deposit contaminated sediments, or expose residual sediment contamination.
- The Project has a potential for adverse effects to worker safety and public health from construction activities due to potential exposure to hazardous materials.
- There is the potential for adverse effects to the Project from demolition of structures containing lead or asbestos-containing materials.

The degree of the potential impacts would generally increase as additional infrastructure and construction activities are added for the Build Alternatives. However, the increase in potential impacts is not such that one Build Alternative has significantly greater adverse impacts (or beneficial affects) than another, solely based on hazardous materials in the absence of mitigation strategies.

8 Mitigation Measures

The following section provides mitigation measures for each of the potential impacts identified. It should be noted that mitigation measures among the Alternatives are generally similar and consistent. Mitigation measures are provided for the Retrofit Alternative below, but are generally applicable to all Build Alternatives. Differences, if any, are outlined in the subsequent sections.

8.1 Enhanced Seismic Retrofit Alternative

Mitigation measures are provided for (1) property acquisition, (2) impacts of hazardous materials encountered during construction, (3) impacts on hazardous resources from construction activities, and (4) cumulative impacts.

8.1.1 Property Acquisition Mitigation Measures

Environmental due diligence is recommended for all properties to be acquired and/or for properties that have significant associated construction activities. Environmental due diligence can take many forms. However, typical environmental due diligence includes the completion of Phase I and/or Phase II Environmental Site Assessments (ESAs). The

focus of environmental due diligence is to determine the potential for environmental liability (existing contamination, current operational practices, construction worker health and safety, etc.) associated with a particular property. The following sections describe the completion of Phase I and II ESAs.

Phase I Environmental Site Assessments

Phase I ESAs are designed to help identify liability issues associated with purchasing a facility or property. These assessments are typically completed prior to acquisition of a property to establish the baseline conditions. This action protects the purchaser if financial or legal liability results from pre-existing contamination. ASTM E 1527-13 establishes parameters that define how Phase I ESAs are to be performed. It is recommended that all properties that would be acquired or have significant associated construction activities be subject to minimum due diligence in the form of a Phase I ESA.

Phase II Environmental Site Assessment

A Phase II ESA might be necessary for property acquisition or prior to construction if the Phase I ESA determines that the property has a high likelihood of contamination. The Phase II ESA would be conducted in a manner that is consistent with DEQ and ASTM; this effort can involve collecting samples of soil, groundwater, and building materials. The most frequent analytical tests are for the presence of petroleum hydrocarbons, metals, pesticides, solvents, asbestos, or lead-based paint. A Phase II ESA can be simple, such as investigating a UST, or complex, in cases where the site has a long, intensive history and multiple environmental issues. Notification to DEQ may be required if unknown contamination is encountered during the assessment. Findings of the Phase II ESA would be used to develop avoidance strategies or to help guide appropriate cleanup actions or construction management options.

8.1.2 Mitigation Measures for Hazardous Materials Encountered During Construction

Preparation and implementation of the plans, programs, and procedures described below are standard industry practice for construction activities occurring in areas with a potential for hazardous materials–related conditions to be encountered during construction. Many components of these plans and programs are required by state and federal regulations. In general, the plans and programs identify potential hazards, designate personnel responsible for hazardous materials management, and establish uniform procedures for managing contamination when it is encountered, including protocols for sampling, handling, and disposal.

Hazardous Building Materials Survey and Abatement Program

In accordance with Safety Standards for Construction Work: Lead (WAC 296-155) and General Occupational Health Standards: Asbestos (WAC 296-62 Part I-1), hazardous building material surveys would be conducted on structures proposed for demolition prior to demolition to identify any asbestos-containing materials, lead-based paint, and other hazardous materials. Based on the survey results, any necessary abatement would be conducted prior to demolition. Lead-based paint, asbestos-containing materials, and

other hazardous materials would be disposed of at facilities permitted to receive these materials in accordance with federal, state, and local agency regulations.

Health and Safety Plan

A Project-wide construction health and safety plan would minimize the potential for exposure of construction workers to hazardous materials and the risk to human health and the environment. Health and safety plans are required by federal Occupational Safety and Health Act regulations and state regulations.

Contaminated Media Management Plan

A site-specific contaminated media management plan would ensure proper characterization, management, storage, disposal, and reporting of contaminated materials encountered during construction activities. The plan could outline the roles and responsibilities of personnel; health and safety requirements; methods and procedures for characterizing, managing, storing, and disposing of waste; and reporting requirements.

8.1.3 Mitigation Measures for Impacts on Environmental Resources from Construction Activities

Plans and guidance would be prepared to comply with city, state, and federal requirements for construction activities, including description and implementation of BMPs to prevent pollution, control stormwater flows, and protect the Willamette River during construction. The plans would likely consist of a spill plan and a construction stormwater and erosion control plan.

Spill Plan

A site-specific spill plan would address the use, storage, and disposal of hazardous materials used during Project staging and construction. Such materials could include asphalt, fuel, raw concrete, solvents, paint, landscaping chemicals, and other materials whose release could affect human health and the environment. The spill plan would also address the prevention of and response to potential releases of hazardous materials used or encountered during Project staging and construction.

Construction Stormwater and Erosion Control Plan

A site-specific construction stormwater and erosion control plan would identify BMPs to prevent or minimize the potential for stormwater to transport contaminants into surface waters during Project construction.

Sediment Evaluation Framework

Based on the anticipated in-water construction activities, Project planning would need to consider sampling and analysis of sediment to characterize existing conditions and provide data to support permit applications and requirements. The sediment evaluation framework, which includes a sampling and analysis plan, pre-construction sediment sampling, permitting, and a number of other activities, documentation, and construction standards, would be required for in-water work activities. The permit tasks and approvals

can take significant time and should be implemented as early in the design phase as possible to avoid schedule delays and unexpected issues. The Portland Sediment Evaluation Team, as well as other agencies (EPA, U.S. Army Corps of Engineers, etc.), should be engaged with the Project during the planning stages to provide guidance and requirements for sediment impacts to mitigate potential schedule delays and achieve timely permit approvals.

8.1.4 Mitigation Measure for Cumulative Impacts

A number of reasonably foreseeable actions may have some adverse impacts on hazardous materials and be adversely affected by hazardous materials during construction and operation. However, these potential impacts could be largely mitigated by Project-related measures. No additional mitigation measures were identified.

Mitigation of construction-related cumulative impacts from hazardous materials could be accomplished through implementing measures such as those presented above. Such measures could include conducting due diligence before potentially contaminated property is acquired; surveying for and abating hazardous building materials before structures are demolished; appropriately addressing known contamination or other environmental issues in the Project footprint; and developing and implementing plans to protect worker health and safety, address contaminated materials discovered during construction, and prevent and control spills and stormwater contamination.

Mitigation of operational cumulative impacts from hazardous materials could be accomplished by implementing measures such as those presented above. Such measures could include training and informing maintenance personnel regarding hazardous materials and hazardous materials–related conditions that would exist or could be encountered during maintenance work. These measures could also include developing protocols for maintenance work regarding spill response and agency notification.

8.2 Replacement Alternative with Short-Span Approach

Mitigation measures are similar to those provided above. No additional mitigation measures were identified for this specific Alternative.

8.3 Replacement Alternative with Long-Span Approach

Mitigation measures are similar to those provided above. No additional mitigation measures were identified for this specific Alternative.

8.4 Replacement Alternative with Couch Extension

Mitigation measures are similar to those provided above. No additional mitigation measures were identified for this specific Alternative.

8.5 Temporary Bridge Option

Mitigation measures are similar to those provided above. No additional mitigation measures were identified for this specific option.

9 Contacts and Coordination

Project work will include an extensive public involvement and agency coordination effort including local jurisdictions and neighborhoods within the Project Area.

Agencies and organizations will be notified of the intent to prepare an EIS through the Federal Register and other Project outreach activities. Interested organizations will have the opportunity to review and comment on the hazardous materials analysis throughout the duration of the Project, including during the public comment period for the Draft EIS.

During the hazardous materials impact analysis, the following agencies were contacted for data and other information related to hazardous materials:

- City of Portland Bureau of Environmental Services
- Oregon Department of Environmental Quality
- Oregon Water Resources Division
- Oregon State Fire Marshall
- Oregon Department of Transportation
- U.S. Environmental Protection Agency

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

EXECUTIVE SUMMARY

TARGET PROPERTY SEARCH RESULTS

The target property was not listed in any of the databases searched by EDR.

DATABASES WITH NO MAPPED SITES

No mapped sites were found in EDR's search of available ("reasonably ascertainable ") government records either on the target property or within the search radius around the target property for the following databases:

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL ..... National Priority List
Proposed NPL ..... Proposed National Priority List Sites
NPL LIENS ..... Federal Superfund Liens

Federal Delisted NPL site list

Delisted NPL ..... National Priority List Deletions

Federal CERCLIS list

FEDERAL FACILITY ..... Federal Facility Site Information listing
SEMS ..... Superfund Enterprise Management System

Federal RCRA CORRACTS facilities list

CORRACTS ..... Corrective Action Report

Federal RCRA non-CORRACTS TSD facilities list

Exclusive Recovered Govt. Archives

OR RGA LF..... Recovered Government Archive Solid Waste Facilities List

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

A review of the SEMS-ARCHIVE list, as provided by EDR, and dated 04/11/2019 has revealed that there are 3 SEMS-ARCHIVE sites within approximately 0.125 miles of the target property.

Federal RCRA generators list

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 03/25/2019 has revealed that there are 2 RCRA-SQG sites within approximately 0.125 miles of the target property.

RCRA-CESQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-CESQG list, as provided by EDR, and dated 03/25/2019 has revealed that there are 31 RCRA-CESQG sites within approximately 0.125 miles of the target property.

Federal ERNS list

ERNS: The Emergency Response Notification System records and stores information on reported releases of oil and hazardous substances. The source of this database is the U.S. EPA.

A review of the ERNS list, as provided by EDR, and dated 03/25/2019 has revealed that there are 15 ERNS sites within approximately 0.125 miles of the target property.

State and tribal leaking storage tank lists

OR LUST: The Leaking Underground Storage Tank Incident Reports contain an inventory of reported leaking underground storage tank incidents. The data come from the Department of Environmental Quality's LUST Database List.

A review of the OR LUST list, as provided by EDR, and dated 10/03/2018 has revealed that there are 190 OR LUST sites within approximately 0.125 miles of the target property.

State and tribal registered storage tank lists

OR UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the Department of Environmental Quality's UST List on Disk.

A review of the OR UST list, as provided by EDR, and dated 10/03/2018 has revealed that there are 99 OR UST sites within approximately 0.125 miles of the target property.

EXECUTIVE SUMMARY

Records of Emergency Release Reports

HMIRS: The Hazardous Materials Incident Report System contains hazardous material spill incidents reported to the Department of Transportation. The source of this database is the U.S. EPA.

A review of the HMIRS list, as provided by EDR, and dated 03/25/2019 has revealed that there is 1 HMIRS site within approximately 0.125 miles of the target property.

OR SPILLS 90: Spills 90 includes those spill and release records available exclusively from FirstSearch databases. Typically, they may include chemical, oil and/or hazardous substance spills recorded after 1990. Duplicate records that are already included in EDR incident and release records are not included in Spills 90.

A review of the OR SPILLS 90 list, as provided by EDR, and dated 05/01/2006 has revealed that there are 10 OR SPILLS 90 sites within approximately 0.125 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 03/25/2019 has revealed that there are 136 RCRA NonGen / NLR sites within approximately 0.125 miles of the target property.

EPA WATCH LIST: EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

A review of the EPA WATCH LIST list, as provided by EDR, and dated 08/30/2013 has revealed that there is 1 EPA WATCH LIST site within approximately 0.125 miles of the target property.

EXECUTIVE SUMMARY

TSCA: The Toxic Substances Control Act identifies manufacturers and importers of chemical substances included on the TSCA Chemical Substance Inventory list. It includes data on the production volume of these substances by plant site. The United States Environmental Protection Agency has no current plan to update and/or re-issue this database.

A review of the TSCA list, as provided by EDR, and dated 12/31/2016 has revealed that there are 4 TSCA sites within approximately 0.125 miles of the target property.

SSTS: Section 7 of the Federal Insecticide, Fungicide and Rodenticide Act, as amended (92 Stat. 829) requires all registered pesticide-producing establishments to submit a report to the Environmental Protection Agency by March 1st each year. Each establishment must report the types and amounts of pesticides, active ingredients and devices being produced, and those having been produced and sold or distributed in the past year.

A review of the SSTS list, as provided by EDR, and dated 12/31/2009 has revealed that there is 1 SSTS site within approximately 0.125 miles of the target property.

RMP: When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

A review of the RMP list, as provided by EDR, and dated 04/25/2019 has revealed that there is 1 RMP site within approximately 0.125 miles of the target property.

HIST FTTS: A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

A review of the HIST FTTS list, as provided by EDR, has revealed that there are 8 HIST FTTS sites within approximately 0.125 miles of the target property.

EXECUTIVE SUMMARY

FINDS: The Facility Index System contains both facility information and "pointers" to other sources of information that contain more detail. These include: RCRIS; Permit Compliance System (PCS); Aerometric Information Retrieval System (AIRS); FATES (FIFRA [Federal Insecticide Fungicide Rodenticide Act] and TSCA Enforcement System, FTTS [FIFRA/TSCA Tracking System]; CERCLIS; DOCKET (Enforcement Docket used to manage and track information on civil judicial enforcement cases for all environmental statutes); Federal Underground Injection Control (FURS); Federal Reporting Data System (FRDS); Surface Impoundments (SIA); TSCA Chemicals in Commerce Information System (CICS); PADS; RCRA-J (medical waste transporters/disposers); TRIS; and TSCA. The source of this database is the U.S. EPA/NTIS.

A review of the FINDS list, as provided by EDR, and dated 02/15/2019 has revealed that there are 373 FINDS sites within approximately 0.125 miles of the target property.

EXECUTIVE SUMMARY

Dry Cleaner ID: 162

MA Financial Assurance: Information for hazardous waste facilities. Financial assurance is intended to ensure that resources are available to pay for the cost of closure, post-closure care, and corrective measures if the owner or operator of a regulated facility is unable or unwilling to pay.

A review of the MA Financial Assurance list, as provided by EDR, has revealed that there is 1 MA Financial Assurance site within approximately 0.125 miles of the target property.

AMERICOLD CORP Database: Financial Assurance 2, Date of Government Version: 07/11/2018	151 SW FIFTH AVE	0 - 1/8 (0.000 mi.)	N1033	1020

CA HAZNET: The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000-1,000,000 annually, representing approximately 350,000-500,000 shipments. Data from non-California manifests & continuation sheets are not included at the present time. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, & disposal method. The source is the Department of Toxic Substance Control is the agency. This database begins with calendar year 1993.

A review of the CA HAZNET list, as provided by EDR, and dated 12/31/2017 has revealed that there are 5 CA HAZNET sites within approximately 0.125 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

A review of the EDR MGP list, as provided by EDR, has revealed that there are 5 EDR MGP sites within

approximately 0.125 miles of the target property.

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there are 357 EDR Hist Auto sites within approximately 0.125 miles of the target property.

EDR Hist Cleaner: EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Cleaner list, as provided by EDR, has revealed that there are 230 EDR Hist

EXECUTIVE SUMMARY

Cleaner sites within approximately 0.125 miles of the target property.

EDR RECOVERED GOVERNMENT ARCHIVES

Exclusive Recovered Govt. Archives

OR RGA HWS: The EDR Recovered Government Archive State Hazardous Waste database provides a list of SHWS incidents derived from historical databases and includes many records that no longer appear in current government lists. Compiled from Records formerly available from the Department of Environmental Quality in Oregon.

A review of the OR RGA HWS list, as provided by EDR, has revealed that there are 34 OR RGA HWS sites within approximately 0.125 miles of the target property.

EXECUTIVE SUMMARY

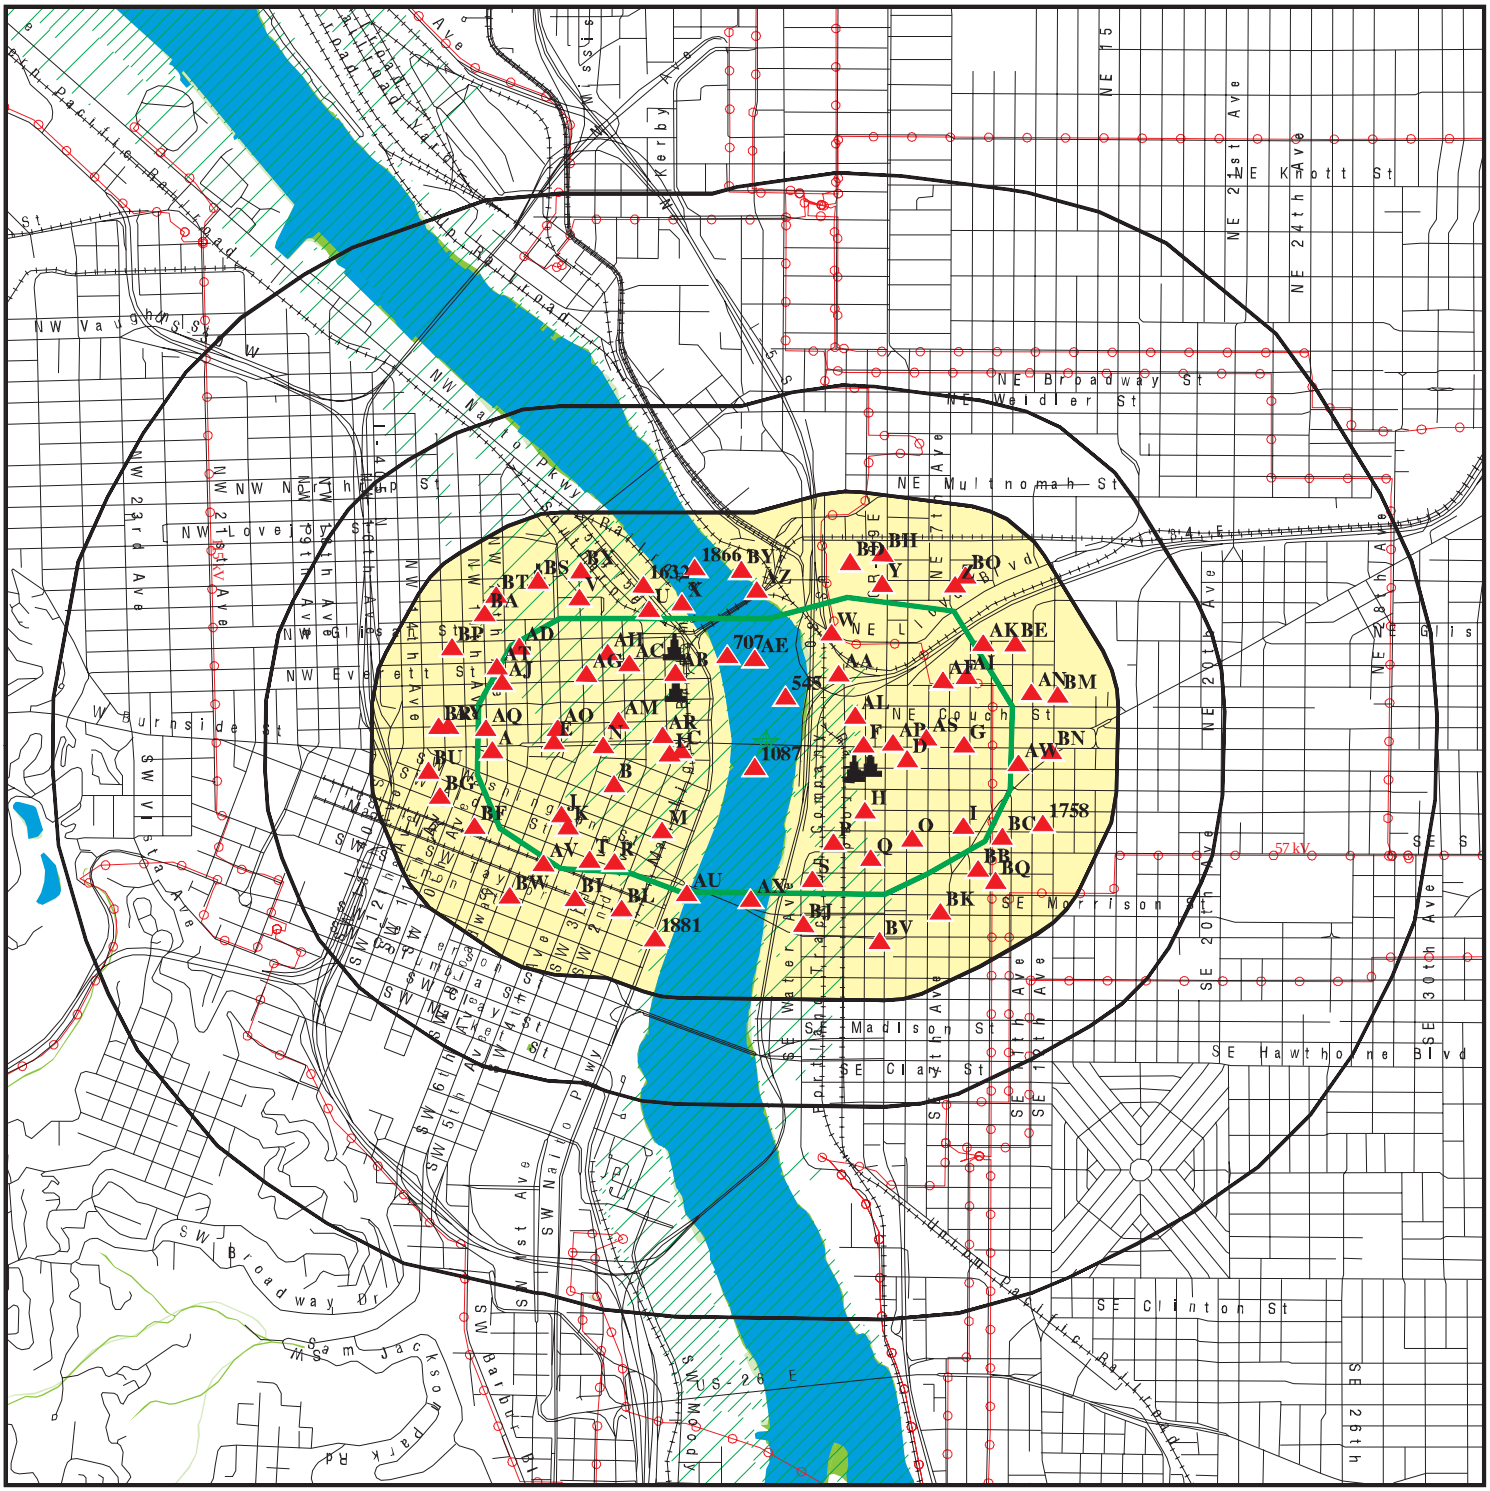
Facility ID: 26-91-0097

EXECUTIVE SUMMARY

Due to poor or inadequate address information, the following sites were not mapped. Count: 9 records.

Site Name	Database(s)
TRI-MET SOUTH CORRIDOR EXTENSION	OR ECSI, OR VCP
V.A.- COLUMBIA SOUTH SHORE WELLFIE	OR ECSI
	OR CDL, OR HAZMAT
	OR CDL, OR HAZMAT
HEATING OIL TANK	OR LUST
PARK BLOCK #5	OR LUST
HEATING OIL TANK	OR LUST
GREYHOUND TANKS	OR LUST
ODOT REGION 1 PARCEL 2C	OR LUST

OVERVIEW MAP - 5681679.1S



Target Property

Sites at elevations higher than or equal to the target property

Sites at elevations lower than the target property

Manufactured Gas Plants

National Priority List Sites

Dept. Defense Sites

0 1/4 1/2 1 Miles

Indian Reservations BIA

Power transmission lines

100-year flood zone

500-year flood zone

National Wetland Inventory

State Wetlands

Areas of Concern

Description Of The Avg Qnty Code:	1,000-4,999
Most Hazardous Ingridient:	PETROLEUM DISTILLATES
United Nations/north America 4 Digit Class Number:	1993
Hazard Rank:	2
EHS Ingredient:	NONE LISTED ON MSDS
Substance Pure:	True

LEVEL 3 COMMUNICATIONS INC (Continued) **S111251632**

Substance Mix:	False
First Hazardous Class Code For Chemical:	Flammable and Combustible Liquid
Second Hazardous Class Code For Chemical:	Chronic Health Hazard
Third Hazardous Class Code For Chemical:	Not reported
Hazard Class 1 Of The Chemical:	3.0
Hazard Class 2 Of The Chemical:	6.4
Hazard Class 3 Of The Chemical:	Not reported

Chemical:

Chemical Name:	DIESEL FUEL 2
United Nations/north America 4 Digit Class Number:	1993
Chemical Abstract Service Identifier Number:	68476346
Chemical Is Extremely Hazardous Substance (EHS):	N
First Hazardous Class Code For Chemical:	Flammable and Combustible Liquid
Second Hazardous Class Code For Chemical:	Chronic Health Hazard
Third Hazardous Class Code For Chemical:	Not reported
Hazard Class 1 Of The Chemical:	3.0
Hazard Class 2 Of The Chemical:	6.4
Hazard Class 3 Of The Chemical:	Not reported
Chemical Is A Toxic 313 Chemical:	N
EPA Pesticide Registration Number:	Not reported
Contains 112R:	N
Contains EHS:	N
Fertilizer:	N
Pesticide:	N
Contains 313:	N

Narrative:
Narrative Id: 7619
Incident Id: 990306
Incident Narrative: E-1 WAS CALLED TO THE SCENE OF A DAY CARE CENTER LOCATED AT 234 SE 7TH. OCCUPANTS INCLUDED WERE CHILDREN UNDER AGE 6 AND 10 ADULTS. OCCUPANTS COMPLAINED OF IRRITATING FUMES ENTERING THE STRUCTURE THROUGH OPEN WINDOW. E-1 ARRIVED AND INVESTIGATED. ONE ROOM HAD SOME TYPE OF SUBSTANCE OR GAS THAT IRRITATE THE RESPIRATORY TRACT BUT HAD NO SMELL. ALL OCCUPANTS WERE EVACUATED OUTSIDE INTO FRESH AIR. T-1 RESPONDED AND PROVIDED FANS FOR VENTILATION OF THE ENTIRE STRUCTURE. HM-41 WAS NOTIFIED BUT WERE NOT REQUESTED TO RESPOND. AN INVESTIGATION WAS CONDUCTED IN THE VICINITY TO TRY AND IDENTIFY A POSSIBLE SOURCE. ONE POSSIBILITY WAS AN INDUSTRIAL OCCUPANCY AT 436 SE 6TH KNOWN AS OREGON PLATING CO. THIS OCCUPANT WAS CLOSED UP FOR THE DAY AT 1230. BUT NEIGHBORS STATED IT WAS OPEN AT THE TIME OF THE INCIDENT. ALL OCCUPANTS OF THE BUILDING (DAY CARE) WERE OKAY AFTER REMOVAL TO FRESH AIR. THERE WERE NO RESIDUAL FUMES AFTER VENTILATION. CONTACT PERSON WAS TRINA GHERE THE HEAD TEACHER. NOTE: THE PLATING CO WAS DIRECTLY UPWIND OF THE DAY CARE CENTER AND HAS AN NFPA 704 PLACARD OF 3-0-2-OXY.

Environmental Interest/Information System

OR-DEQ (Oregon - Department Of Environmental Quality) is a regulatory agency whose job is to protect the quality of Oregon's Environment. DEQ uses a combination of technical assistance, inspections and permitting to help public and private facilities and citizens understand and comply with state and federal environmental regulations.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

FINDS:

Registry ID: 110014276933

Environmental Interest/Information System
OR-DEQ (Oregon - Department Of Environmental Quality) is a regulatory agency whose job is to protect the quality of Oregon's Environment. DEQ uses a combination of technical assistance, inspections and permitting to help public and private facilities and citizens understand and comply with state and federal environmental regulations.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Type Code:	Not reported
Temperature Description:	Not reported
Pressure of Code:	2
Pressure Description:	GREATER THAN NORMAL PRESSURE
Pressure of Code:	Not reported
Pressure Description:	Not reported
Temperature Description:	NORMAL TEMPERATURE
Temperature of The Hazardous Substance Code:	4
Temperature Description:	Not reported
Temperature of The Hazardous Substance Code:	Not reported
Days Hazardous Substance On Site During Year:	365
Is The Substance Protected A Trade Secret:	False
Description Of The Max Qnty Code:	10,000-49,999
Description Of The Avg Qnty Code:	1,000-4,999
Most Hazardous Ingridient:	CHLORODIFLUOROMETHANE
United Nations/north America 4 Digit Class Number:	1018
Hazard Rank:	2
EHS Ingredient:	Not reported
Substance Pure:	False
Substance Mix:	True
First Hazardous Class Code For Chemical:	Non-flammable Gas
Second Hazardous Class Code For Chemical:	Acute Health Hazard
Third Hazardous Class Code For Chemical:	Not reported
Hazard Class 1 Of The Chemical:	2.2
Hazard Class 2 Of The Chemical:	6.3
Hazard Class 3 Of The Chemical:	Not reported

Chemical:

Chemical Name:	REFRIGERANT 22
United Nations/north America 4 Digit Class Number:	1018
Chemical Abstract Service Identifier Number:	75456
Chemical Is Extremely Hazardous Substance (EHS):	N
First Hazardous Class Code For Chemical:	Non-flammable Gas
Second Hazardous Class Code For Chemical:	Acute Health Hazard
Third Hazardous Class Code For Chemical:	Not reported
Hazard Class 1 Of The Chemical:	2.2
Hazard Class 2 Of The Chemical:	6.3
Hazard Class 3 Of The Chemical:	Not reported
Chemical Is A Toxic 313 Chemical:	Y
EPA Pesticide Registration Number:	Not reported
Contains 112R:	N
Contains EHS:	N
Fertilizer:	N
Pesticide:	N
Contains 313:	N

Facility ID:	034838
Department Or Division Of Company:	Not reported
Extremely Hazardous Substance:	Not reported
Facility Has Written Emergency Plan:	Not reported
Contains 112R:	Not reported
NAICS Code 1:	Not reported
NAICS Desc 1:	Not reported
NAICS Code 2:	Not reported
NAICS Desc 2:	Not reported
Manager Name:	Not reported

FINDS:

Registry ID: 110004815344

Environmental Interest/Information System
OR-DEQ (Oregon - Department Of Environmental Quality) is a regulatory agency whose job is to protect the quality of Oregon's Environment. DEQ uses a combination of technical assistance, inspections and permitting to help public and private facilities and citizens understand and comply with state and federal environmental regulations.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Registry ID: 110004811366

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

OR-DEQ (Oregon - Department Of Environmental Quality) is a regulatory agency whose job is to protect the quality of Oregon's Environment. DEQ uses a combination of technical assistance, inspections and permitting to help public and private facilities and citizens understand and comply with state and federal environmental regulations.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

MULTNOMAH CO MCCOY BLDG (Continued) **1001080693**

Handler Activities Summary:

U.S. importer of hazardous waste:	No
Mixed waste (haz. and radioactive):	No
Recycler of hazardous waste:	No
Transporter of hazardous waste:	No
Treater, storer or disposer of HW:	No
Underground injection activity:	No
On-site burner exemption:	No
Furnace exemption:	No
Used oil fuel burner:	No
Used oil processor:	No
User oil refiner:	No
Used oil fuel marketer to burner:	No
Used oil Specification marketer:	No
Used oil transfer facility:	No
Used oil transporter:	No

Hazardous Waste Summary:

. Waste code: NONE
. Waste name: None

Violation Status: No violations found

FINDS:

Registry ID: 110004809244

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
OR-DEQ (Oregon - Department Of Environmental Quality) is a regulatory agency whose job is to protect the quality of Oregon's Environment. DEQ uses a combination of technical assistance, inspections and permitting to help public and private facilities and citizens understand and comply with state and federal environmental regulations.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
OR-DEQ (Oregon - Department Of Environmental Quality) is a regulatory agency whose job is to protect the quality of Oregon's Environment. DEQ uses a combination of technical assistance, inspections and permitting to help public and private facilities and citizens understand and comply with state and federal environmental regulations.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Updated Date: 08/09/2012
Decode for NarcdID: Contamination
NARR Comments: (6/7/05 SMF/SAS) Soils beneath former Manufactured Gas Holding Tanks are often heavily contaminated with hazardous substances that condense from the manufactured gas. (8/9/12, SMF/SAS) A total of 2,184 tons (approx. 1,670 cubic yards) of contaminated soil was removed from three areas of Tax Lot 1400 in 1992. Subsurface soil contamination was attributed to both a leaking underground gasoline storage tank and to releases from historic gas manufacturing operations. Subsurface contamination at the north end of Tax Lot 1400, extending below the top of the groundwater table and beneath SE Ankeny Street, was not removed. Subsurface contamination may also remain in the former UPRR railroad Right-of-Way at the southwest corner of Tax Lot 1400, and may also extend to the south, beneath SE Ash Street. Most analyses that were conducted during the soil removal activities were limited to HCID, TPH-G, TPH-D, TPH-418.1, and TCLP leachable metals analyses as indicators and to generally characterize the soils for waste disposal options, so the complete character of site contamination has not been well-defined. There is no indication that potential subsurface contamination at Tax Lot 400, the location of a former 200,000 cubic foot manufactured gas holding tank, has ever been investigated. Contaminants of potential concern include PAHs, BTEX, trimethylbenzenes, total metals, cyanide, and PCBs. Potential sources for relatively low concentrations of PCB detected at the southwest end of Tax Lot 1400 are unknown.

NARR Comments: A Report on Underground Storage Tank Contaminated Soil Cleanup, John Alden Life Insurance Property, 220 SE Ankeny Street, Portland, Oregon, HAI Project #1958, prepared for John Alden Life Insurance Co., by Hahn and Associates, Inc., June 8, 1992. A Report on Petroleum Contaminated Soil Cleanup, John Alden Life Insurance Property, 220 SE Ankeny Street, Portland, Oregon, HAI Project #1958, prepared for John Alden Life Insurance Co., by Hahn and Associates, Inc., June 19, 1992. See LUST File 26-92-0006 for further information relating to the underground tank removal activities. Evidently, Technical Action Group, Inc. (TAG) previously performed Level I (Phase I Environmental Site Assessment, Block 65, Lots 1-8, East Portland Addition, prepared by Technical Action Group, Inc., December 31, 1991) and Level II (report title unknown, prepared by TAG in January 1992) environmental assessments for this property, although DEQ has not been able to obtained copies of either of these reports

E PORTLAND GAS WORKS (FORMER) (Continued) **S107692390**

for review. A General Synopsis of TAG's Level II activities is included in Appendix A of Hahn and Associate's June 19, 1992 report. A November 7, 1987 survey map perpared by W.B. Wells and Associates, Inc. reportedly identified an historic fuel storage shed along the southern central boundary of Tax Lot 1400, although DEQ has not obtained a copy of the survey map for review, and is unaware of the source of W.B. Wells' information.

NARR Comments: Two tax lots in an industrial/commercial section of SE Portland, located on diagonally opposite corners of the intersection of SE 3rd Avenue and SE Ankeny Street. Tax Lot 1400 (this site), is the southwestern tax lot that occupies an entire city block, and is covered by paving and a 2-story building used as a fresh produce distribution facility. Tax Lot 400 (ECSI #5798), the northeastern tax lot, occupies 1/4 of a city block, and is a slightly elevated, paved parking lot for Fishel's Furniture, a retail furniture business.

NARR Comments: Manufactured Gas Plant wastes, which are typically comprised of coke, ash, coal tar, tar decanter sludge, ammonia liquor, and gas purifier wastes. Potential hazardous substances include PAHs, BTEX, trimethylbenzenes, phenols, toxic metals (often including arsenic, chromium, lead, and mercury), and cyanide. PCBs (Total PCBs, Aroclor 1260, and Aroclor 1262) have also been detected at relatively low concentrations in site soils.

Decode for NarcdID: Project Issues Summary
NARR Comments: There is no indication that subsurface soils and groundwater beneath the former 200,000 cubic yard gas holder tank on Tax Lot 400 have ever been investigated for potential contamination from manufactured gas condensates. A substantial soil cleanup was conducted on Tax Lot 1400 in 1992, although subsurface contamination was never fully characterized. Soil contamination at the north end of the tax lot that extended beneath the top of the groundwater was not cleaned up. Shallow groundwater in this area was contaminated with PAHs, although the extent of groundwater contamination was not defined, and no groundwater cleanup was conducted. Subsurface soil contamination that extended beneath SE Ankeny Street was also left in place. Potential

E PORTLAND GAS WORKS (FORMER) (Continued) **S107692390**

subsurface contamination was not explored in a former railroad Right-of-Way at the southwest corner of Tax Lot 1400. Subsurface contamination may also extend to the south beneath SE Ash Street. Relatively low concentrations of PCB from an unknown source were detected in soils at the southwestern end of the site. it's not known how extensively soils may have been contaminated with PCBs. It is not known where or how wastes from former gas manufacturing plant were disposed. An apparent common local gas manufacturing plant waste disposal practice at the time was to use the wastes as fill in nearby low-lying areas. At the time that the gas plant was operating, undeveloped low-lying areas were present immediately to the north, northwest, west, and southwest of the plant. Any residual subsurface contamination might represent a potential risk for utility trench workers, future construction workers, a potential vapor intrusion risk for workers in nearby buildings, or a potential ecological risk to Threatened and Endangered salmonids in the river, or to consumers of fish caught from this reach of the river.

Decode for NarcdID: Site Location
NARR Comments: Location Summary: The site lies directly across the Willamette River from downtown Portland, and is comprised of two tax lots: Tax Lot 400 and Tax Lot 1400 of T1N/R1E-S34DD. Tax Lot 400 is NE of the intersection of SE 3rd Avenue and SE Ankeny Street, and Tax Lot 1400 is SW of the intersection. Tax Lot 400 occupies the southwestern quarter of East Portland Block 77, while Tax Lot 1400 occupies the entirety of East Portland Block 65. East Burnside Street, which is an elevated on-ramp to the east end of the Burnside Bridge in this area, lies along the northern edge of Block 77; SE M.L. King Jr. Blvd. (Oregon Hwy 99E) lies along the block's eastern edge. The Willamette River lies about 680 feet west of Block 65. Location Details: An 1899 Sanborn Fire Insurance Map shows the northern half of Tax Lot 1400 (then Block 950)(bounded by SE 2nd Ave (at that time, SE 2nd Street) on the west, SE 3rd Ave. (at that time, SE 3rd Street) on the east, SE Ankeny Street (at that time, G Street) on the north, and SE Ash Street (at that time, H Street) on the south as the location of E. Portland Gas Works. At that time, the site had a Gas Holder tank and a retort. A 1901 Sanborn Fire Insurance Map indicates a Gas Holder tank, Purifier Room, and Coal Shed on the northern half of Block 950, but notes that only the Gas Holder was in operation, being filled from Works on the West Side. (the note also mentions 3 retorts at the

E PORTLAND GAS WORKS (FORMER) (Continued) **S107692390**

site). A 1909 Sanborn Fire Insurance Map indicates that a Gas Holder tank was present on Block 950, but was no longer used. However, diagonally across the intersection of E 3rd Street and E Ankeny Street (northeast of the former gas plant), a new 300,000 cu. ft. Gas Holder tank and Gas Pump were located on the southwest quarter of Block 977. A 1928 Sanborn Fire Insurance Map shows a Building Materials Warehouse located on the northwest quarter of Block 950, and the 300,000 cu. ft. Gas Holder tank on the southwest quarter of Block 977. A 1950 Sanborn Fire Insurance Map shows that the Building Materials Warehouse on the northwest quarter of Block 950 had been expanded to cover the northeast quarter also, while the southwest quarter of Block 977 had been converted to an auto parking lot.

NARR Comments: Tax lot 1400 owner: Michael G. Myers, 110 SE 2nd Avenue, Portland, OR 97214 (P.O. Box 14921, Portland, OR 97293). Tax lot 1400 / 110 SE 2nd Avenue is the current location of: Coastal, Inc. and Central Dispatch, Inc. Mr. Myers previously owned Coastal, Inc., but recently retired and sold the business, while maintaining ownership of the property. Tax Lot 400 owner: Listed in Multnomah County Tax Assessor records as MKB Investment Co. - Fishels, although Oregon Corporate Records indicate that MKB Investment Co. has been an inactive corporation since 2006. Tax Lot 400 / 5 SE M.L.King Blvd. is the current location of: Fishel's Inc. (Larry Talbott, President; Martin Fishel, Secretary);[NOTE: Martin Fishel is actually deceased]; SF Leromaho, LLC (Scott Fishel, Manager). The information listed above was obtained from the Oregon Secretary of State's Corporate Division files. However, according to Doris Gulden at Fishel's Furniture, Martin Fishel died about 10 years ago, and the business is now owned by Bradley and Karen Fishel, Martin Fishel's son and daughter-in-law.

NARR Comments: (6/7/05 SMF/SAS) A fresh produce distribution business is currently located on Tax Lot 1400, over the location of the former gas plant, although all of the site appears to be paved or covered by a building. Tax Lot 400, the site of the more recent Gas Holder Tank, is a paved parking lot for Fishel's Furniture, a retail furniture business. Subsurface contamination could represent a potential threat to utility trench workers or future construction workers. Drinking water mains lie beneath SE 3rd Avenue and SE Ash Street, and municipal sewer mains lie beneath SE 3rd Avenue and SE 2nd Avenue. Vapors from any potential groundwater contamination might also represent a potential threat to workers within nearby businesses. Potential groundwater contaminants could discharge to the Willamette River either by direct groundwater discharge, or by entering stormsewer mains. Stormwater catchbasins are located near the northwest and southwest corners of Block 65. An Oregon Highway Division stormsewer originating near the northwest corner of Block 65 discharges to the river beneath the Burnside Bridge. A city stormsewer originating near the southwest corner of Block 65 discharges to the river near the western terminus of SE Oak Street (City Outfall #38). A combined sewer beneath SE 3rd Avenue was designed to overflow to a stormsewer that discharges to the river at City Outfall #38. The City of Portland is nearing completion of constructing a new combined sewer tunnel that lies about 95 feet below SE 3rd Avenue. It is unclear to Site Assessment at this time how the City of Portland will be redirecting stormwater flow in this area once the new combined sewer tunnel is in full operation. It is unclear if site contaminants may have contributed to sediment contamination that has been documented in the Willamette River reach nearest the site.

Updated By: SFORTUN
Updated Date: 08/09/2012
Decode for NarcdID: Water Use (Current/Reasonably Likely)
NARR Comments: There are records for 10 groundwater production wells within 0.5-mile of the site. All are located either upgradient or cross gradient from the site. There are no known wells located directly downgradient from the site. Use of all but two of the wells is currently unknown. Two wells belong to a registered drinking water supply (serving drinking water to a transcient population of 110) located slightly less than 0.4 mile upgradient from the site. Groundwater probably discharges to the Willamette River. There are no known surface water drinking water intakes within about 30 miles downstream from the site. The Willamette River is heavily used for recreation (swimming, boating, water-skiing, fishing), along with some undefined subsistence fishing. The reach of the river nearest the site is Critical Habiata for migrating and rearing Threatened and Endangered salmonids.

NARR Comments: A gas manufacturing plant and gas holder tanks were present on the site from sometime in the 1800's (before 1889) until sometime before about 1948. The gas manufacturing plant was replaced by a building materials warehouse sometime between 1909 and 1924. The building

E PORTLAND GAS WORKS (FORMER) (Continued) **S107692390**

materials warehouse was torn down in 1988, and replaced by a fresh produce distribution business in 1993. The large gas holder tank on the northeastern tax lot was installed sometime between 1901 and 1909, and replaced with a parking lot sometime before about 1948.

NARR Comments: Further site investigation and cleanup or risk assessment are needed. An extensive cleanup of contaminated soils was conducted on Tax Lot 1400 prior to redevelopment of that lot in 1992. However, soil contamination that extended below the top of the shallow groundwater table was not cleaned up. A groundwater sample from the north end of Tax Lot 1400 was contaminated with PAHs, although no groundwater cleanup was conducted. Groundwater from other portions of the site was not analyzed. Subsurface contamination that is known to have extended beneath SE Ankeny Street was also left in place. Subsurface soil contamination may extend to the southwest, into an area of a former railroad Right-of-Way, and possibly to the south, beneath SE Ash Street. Soils and groundwater beneath the foundation of a former building materials warehouse (northwest quarter of Tax lot 1400) may not have been adequately investigated. There has been no known investigation or cleanups of soils on Tax Lot 400, where a 200,000 cubic yard gas holder tank was once located.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

OR-DEQ (Oregon - Department Of Environmental Quality) is a regulatory agency whose job is to protect the quality of Oregon's Environment. DEQ uses a combination of technical assistance, inspections and permitting to help public and private facilities and citizens understand and comply with state and federal environmental regulations.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA

MILLER PAINT CO (Continued) **1004770741**

program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

BROAD SPECTRUM ELECTRONICS #2 (Continued) **1000145186**

NARR Comments: This site was once leased by Peter O. Haney. It is alleged that Haney sold small electrical capacitors potentially containing PCBs from this shop, and may have stored articles containing PCBs in the basement of the building. DEQ could find no evidence of PCB releases at the site during its August 1987 site visit.

NARR Comments: A 4-story brick building that occupies 1/4 of the block, located at the NE intersection of SE Stark St. and SE Grand Ave. The upper three floors of the building are used as apartments, but were historically used as hotel rooms. The ground floor has historically housed commercial retail establishments. The north/south alley behind the building has been boarded off.

Decode for NarcdID: Site History
NARR Comments: Historic activities at five other Portland sites that were operated by Peter O. Haney suggested that this site may have been contaminated with PCBs from improper transformer and capacitor handling. This site was a sales outlet for salvaged electronic and electrical equipment. An August 1987 site visit by DEQ indicated no evidence of on-site releases, however.

NARR Comments: There is no data indicating whether or not hazardous substances associated with the site's plating operations may have migrated beyond the confines of the facility's basement. However: 1. The facility is more than 80 years old, and plating operations have been conducted within the building for more than 75 years. 2. The concrete basement floor where plating operations are conducted is coated with an acid-resistant coating. However, a. cracks have been discovered in the coating within a diked secondary containment structure surrounding one of the process's rinse tanks; b. several photos of

OREGON PLATING COMPANY INC (Continued) **1000236252**

the coated floor suggest that cracks may be present beneath the floor coating outside of the secondary containment structures; and c. staining, and in some cases, spilled plating solutions, were present on the floor and walls outside of the facility's secondary containment structures; 3. The basement floor has floor drains which are believed to be plumbed to a basement sump, although there are no available as-built drawings of the subfloor plumbing, and it is unlikely that the subfloor plumbing would have originally been designed to withstand the corrosive effects of plating-related solutions. A Focused Feasibility Study (FFS) was completed in 2013 that documents soil and groundwater contamination below the building foundation. The FFS recommends Interim Remedial Actions for the site and is included as an attachment in WebDocs.

OREGON PLATING COMPANY INC (Continued) **1000236252**

NARR Comments: The site is comprised of a 10,000 square foot, 1-story, reinforced concrete structure located on an 11,000 square foot tax lot within an area of SE Portland that is zoned for commercial and industrial use. The building shares its northern exterior wall with an adjoining commercial structure; public sidewalks and paved streets are located along the building s western and southern perimeters (see Figure 4). Oregon Plating Company owns the entire 10,000 square foot building, although plating operations (see Figure 5) are conducted only within the building s basement. The building s ground floor is currently rented to Art Home Company, an art and framing shop, Arno Piano Repair, and Liquid Moves Entertainment / Center Space, a dance and activity center. A Focused Feasibility Study (FFS) was completed in 2013 that documents soil and groundwater contamination below the building foundation. The FFS recommends Interim Remedial Actions for the site and is included as an attachment in WebDocs.

NARR Comments: Over the past 85 years, the facility has used a variety hazardous materials including acids, bases, toxic metals (chromium, copper, nickel, silver, zinc, lead, cadmium), cyanide salts, ammonium salts, and chlorinated solvents (methylene chloride). Hazardous substances have likely been present in the form of liquid solutions, liquid mists, gaseous vapors, and dusts generated through sandblasting and mechanical polishing.

Decode for NarcdID: Project Issues Summary
NARR Comments: DEQ s Hazardous Waste program referred the Oregon Plating Company site to Site Assessment based on observed hazardous substance handling and storage conditions within the facility. DEQ s Cleanup Program only addresses sites where contaminants have been released to the environment, or where there is a significant threat of a release to the environment. Although there have been documented releases of hazardous substance within the facility, there is only circumstantial evidence and no test data - indicating that contaminants may have actually escaped the building confines. The concrete floor of the Oregon Plating Company s basement is coated with an acid-resistant coating. However, plating operations in this building began more than 75 years ago, and it is not known when acid-resistant coatings were first applied to the floor, or how well the coatings have been maintained over the years. Photos from DEQ s October 2005 HW Compliance Inspection of the facility also depict areas of the flooring where cracks may be present beneath the coating (see Plates 4 through 6) . In April 2008, DEQ Hazardous Waste inspectors learned that cracks had been discovered in the protective coating in a diked secondary containment structure surrounding one of the facility s

OREGON PLATING COMPANY INC (Continued) **1000236252**

rinse tanks . Discontinuities or disruptions in the floor s acid-resistant coating could allow waste plating solutions to migrate through the concrete floor and into underlying soils. It is not known how well seams between the basement s floor and concrete walls are sealed. Significant gaps are typically present between basement floors and walls at the time of building construction. Unless these gaps have been adequately sealed, accumulated particulates or ponded liquids at the wall / floor interface can migrate to the subsurface. Photo D of Plates 1 and 3, and photo A of Plate 3 each depict staining that extends upward from the facility s basement floor onto the basement walls. This should be a particular concern along the facility s collapsing east wall, where it would be difficult to maintain waterproof seals. The City of Portland suspects that a floor drain in the facility s basement floor is plumbed to a sump near the basement s south wall, although neither the city nor the plating company has plumbing diagrams of the floor drainage system. Since the building appears to have been constructed up to six years before site electroplating operations began, it is unlikely that special design features or engineering controls were applied during construction of the basement s floor drain or sump systems. Considering the age of the building and the corrosive nature of materials that have been handled within the building, subfloor plumbing components are likely to have significantly degraded over time, and leaked. Any leaks in the subfloor drainage system might allow hazardous substances to migrate to the subsurface. Any hazardous substances migrating to subsurface soils beneath the facility might also contaminate the area s seasonally shallow groundwater. Potential groundwater contamination could represent a threat to nearby downgradient wells. During periods of high groundwater tables, contaminated groundwater could also discharge to municipal stormsewers or preferentially migrate to the river along the sewer bedding. The nearest municipal stormsewer is a 6-foot diameter, brick and concrete sewer pipe that was constructed 8.5-14.5 feet beneath SE Stark Street in 1911. It gravity-drains westward along SE Stark Street, then discharges to the Willamette River at City Stormwater Outfall #37 (see Figures 10 and 11). Depending on the character of material that was used to backfill the gulch that historically passed beneath the facility, contaminated groundwater might also preferentially migrate along the former gulch and discharge to the Willamette River between SE Stark and Oak Streets. Dye tests conducted by the City of Portland in February 2008 demonstrated that the facility s sump discharges only to the municipal sanitary sewer. However, a 1977 Portland Public Works wastewater sampling diagram of the facility suggests that the sump may have discharged to the municipal stormsewer at that time (see Figure 9). Plumbing permit records from the City of Portland describe modifications to the facility s plumbing in 1930, 1955, 1970, 2001, and 2006. The plumbing permits provide only very limited information about the actual changes in the building s plumbing. Only the 2001 and 2006 plumbing permits suggest potential modifications to the facility s stormsewer lateral feed line. Any potential discharges of the facility s plating wastes to the municipal stormsewer could have contaminated Willamette River surface water and sediments at City Outfall #37. GSI Water Solutions, Inc. has proposed the sampling of shallow and deep river sediments beneath City Outfalls #37 and #38 during April 2008 as part of a search for potential sediment contamination sources upstream from the Portland Harbor Superfund site (ECSI #2068; CERCLIS #SFN1002155). City Outfall #38 is located

OREGON PLATING COMPANY INC (Continued) **1000236252**

about 50 feet downstream from the area where the historic gulch is likely to have reached the river. Analyses of river sediments at Outfalls #37 and #38 should be useful in determining whether groundwater or stormwater discharging to this area of the river has been contaminated with significant concentrations of electroplating wastes. Water that infiltrated into Oregon Plating Company s basement during the December 2007 water main leak is likely to have dissolved residual wastes from the basement floor. The PFD pumped some of this water into the nearby stormsewer, but the concentrations of wastes in this water are unlikely to have been sufficiently high to significantly affect Willamette River sediments.

Decode for NarcdID: Land Use (Current/Reasonably Likely)
NARR Comments: The area surrounding the facility is zoned for mixed commercial and industrial use. While commercial land use predominates in the immediate vicinity of the site, low-income apartments are located as near as 160 feet west of the facility. Social service organizations operate from offices as near as 160 feet to the south, 225 feet to the southeast, and 440 feet to the north-northeast of the site (see Figure 6). A child daycare facility is located about 440 feet north-northeast of the facility.

NARR Comments: The plating facility is located in a commercial building on the east side of SE 6th Avenue. The building occupies the southwest quarter of the block between SE Oak and SE Stark Streets, and SE 6th and SE 7th Avenues (see Figures 1 through 4). SE Grand Avenue, the northbound lanes of Oregon Highway 99E, is located one block west of the facility; the Willamette River lies about 1,850 feet west of the site.

Updated Date: 11/12/2014
Decode for NarcdID: Pathways & Other Hazards
NARR Comments: Potential contaminant release and migration pathways include: 1. potential releases of airborne vapors, mists, or dust; 2. potential migration of plating wastes to soils and shallow groundwater beneath the facility; and 3. potential historic releases of wastes to the nearby municipal stormsewer, which discharges to the Willamette River at Outfall #37. Any airborne releases of contaminants might represent a threat to nearby residents, pedestrians, or workers and customers in nearby commercial facilities. There have been no reports of airborn releases since potential releases associated with two Pollution Complaints in 1990. Since the locale of the site is generally covered by buildings, concrete sidewalks, and paved streets, direct public contact with potential soil contamination should be quite limited. Potential subsurface soil contamination could represent a threat to: 1. utility trench workers; and 2. any future construction workers that may be working in soils excavated at the site. Potential releases to soils beneath the facility would likely also contaminated shallow groundwater. Groundwater contamination could represent a potential threat to: 1. downgradient well users; and 2. aquatic life in the Willamette River. The Portland Fire Department pumped potentially contaminated water from the facility's basement to the nearby municipal stormsewer on December 31, 2007. Plating wastes may also have been historically discharged to the nearby stormsewer. Contaminant releases to the stormsewer could represent a threat to: 1. sewer maintenance workers; and 2. aquatic life and wildlife in the Willamette River, including Threatened and Endangered anadromous fish, and migratory waterfowl protected by international treaty.

NARR Comments: Although the site is located in an area having a disproportionately high concentration of individuals living below the federal poverty level (a Vulnerable Area), the site locale is generally covered by buildings, concrete sidewalks, and paved streets. Direct public contact with any potential released contaminants, airborne releases notwithstanding, should be quite limited. The most likely receptors for hazardous substances potentially released at the site would likely be limited to: aquatic life and wildlife in the Willamette River; well water users directly downgradient from the site; sewer maintenance workers; utility trench workers; and any future construction workers that may be working in soils excavated at the site.

NARR ID: 5750339
NARR Code: Water Use (Current/Reasonably Likely)
Created By: SFORTUN
Created Date: 04/10/2008
Updated By: SFORTUN
Updated Date: 04/11/2008
Decode for NarcdID: Water Use (Current/Reasonably Likely)
NARR Comments: Drinking Water Supply: The City of Portland has a well-developed and readily-accessible Community Drinking Water Supply system with surface water sources from reservoirs within in the Bull Run Watershed, on the west slope of Mt. Hood, at least 25 miles east-southeast of the site, and supplemental groundwater sources from deep wells along the south shore of the Columbia River, over 6 miles east-northeast of the site. Groundwater: Oregon Water Resources Department [OWRD] and the U.S. Geological Survey [USGS] have records for over 50 production wells within one mile of the site (see Figure 8). The vast majority of these wells appear to be industrial-use wells. The Willamette River channel is over 1,100 feet wide and more than 50 feet deep near the site, and substantial groundwater recharge occurs in the West Hills on the west edge of downtown Portland, so it appears very unlikely that wells on the west side of the river would be affected by any contaminant releases at the site. At least four production wells are located within + mile of the site; at least 14 wells lie within + mile of the site (see Figure 8). The nearest well appears to be a 90 foot deep well (MULT 1008) located at an outdoor supply and military surplus goods store about 250 feet northwest of the Oregon Plating Company facility. When the well was constructed in 1961, its proposed use was described as other , although a Certified Water Right was issued in 1963, allowing groundwater to be used for

OREGON PLATING COMPANY INC (Continued) **1000236252**

air conditioning. The nearest domestic-use well (MULT 83130 / MULT 86582) appears to be a 290 foot deep well about 0.3 mile northeast of the site. The well was installed in 2006 on an undeveloped lot adjacent to a commercial rock climbing gym and a Housing Authority of Portland transitional housing unit for the homeless. The boring log for this well proposed that the well be used for both domestic purposes and for thermal-use (such as heating and air conditioning). OWRD has records for three industrial wells located 850- to 1,500 feet west of the facility, between the facility and the Willamette River. The nearest is a 12-inch diameter, 263 foot deep well that was installed for the former Corvallis Creamery. The site is currently occupied by a cafT, a food-distribution warehouse, and several unrelated small businesses. It is not known if the well is still being used or still exists. OWRD records indicate that three industrial wells were installed for Northwest Ice & Cold Storage Company, about 1,500 feet west of the site, in 1912-28. The wells were 235-265 feet deep, and 8- to 12 inches in diameter. OWRD records indicate that one of the wells was decommissioned in 1988, although there are no decommissioning records for the two remaining wells. It is not know if the wells still exist or are still being used. A new building that houses a woodwork supplier was constructed on the northern portion of the former Northwest Ice & Cold Storage Company site in 1996. The Youth Progress Association, a non-profit independent living organization for adjudicated youth, and the Youth Progress Learning Center, a provisionally-accredited special purpose school for adjudicated youth, occupy part of the former site. OWRD also has records for an 8-inch diameter, 105 foot deep industrial well installed about 1,000 feet east of (upgradient from) the Oregon Plating Company. The well was installed in 1956 for Lewis Brothers, Inc., a food processor. The site is currently owned by Northwest Medical, Inc., a hospital and nursing home durable goods supplier. Current use of the well is not known, although a Water Right Certification that was issued in 1961 for industrial use of groundwater remains on file at OWRD, and has not been revoked. Surface Water: The nearest downgradient surface water body is the Willamette River, about 1,850 feet (0.35 mile) west of the site. In the Portland area, the Willamette River is used for recreational boating and swimming, and for sport, tribal, and limited commercial fishing. The river also provides important migratory and rearing habitat for Threatened and Endangered anadromous fish, including coho and Chinook salmon and steelhead trout, as well as seasonal habitat for migratory waterfowl, and foraging habitat for other protected bird species such as the bald eagle. Migratory waterfowl are protected by international treaty. The bald eagle is federally-listed Threatened Species.

NARR Comments: The plating company has had several owners, and has operated under several names and from several Portland locations since it was first established over 100 years ago. Oregon Plating Works was established in 1890, and previously operated at three SW Portland locations, and

OREGON PLATING COMPANY INC (Continued) **1000236252**

from another SE Portland facility at the nearby intersection of SE Oak Street and MLK Boulevard. The company changed its name to Oregon Plating Company in 1930. From 1920 to 1967, the company simultaneously operated under two names: Oregon Plating Company and Electro Products Company. The SE 6th Avenue facility was constructed in 1924, although plating operations did not begin at this facility until about 1930. Sanborn Fire Insurance Maps indicate that the facility was damaged by fire in about 1950. At that time, Sanborn maps depict another plating operation in a building less than one block south of the site, although there is no indication whether this may have been a temporary operating location for Oregon Plating Company. Linda Pitt and Gary Davis purchased the business in 1984. Ms. Pitt has been the sole owner since 1995.

NARR Comments: Oregon Plating Company has conducted electroplating activities in the same SE Portland facility for over 75 years. Current electroplating activities are confined to the facility s basement. Although the company appears to have been in compliance with their Air Contaminant Discharge and Pre-Treated Wastewater Discharge Permits for the past six or more years, recent DEQ Hazardous Waste Compliance Inspections have documented operating and waste handling conditions and practices that could result in contaminant releases to the environment. The facility s concrete basement floor is coated with an acid-resistant coating. It is unclear when the floors were first coated, and how well the coating has been maintained. The basement floor also has floor drains which are believed to be plumbed to a basement sump. Plating wastewaters are collected in the sump, and recent dye tests have verified that the sump discharges to the municipal sanitary sewer. However, the building appears to have been constructed at least six years before site plating operations began, and subfloor plumbing may not have been adequately engineered to withstand corrosive electroplating wastes. Cracks in the acic-resistant floor coating or the underlying concrete could have allowed wastes to migrate through the floor and into underlying soils and shallow groundwater. Subfloor plumbing leaks could have released contaminants directly to underlying soils and shallow groundwater. Groundwater contamination could represent a threat to nearby downgradient well users. Subsurface soil contamination could represent a potential threat to utility trench workers or future construction workers that handle excavated soils. A historic city wastewater monitoring diagram of the facility suggests that the sump may have been plumbed to the municipal stormsewer in the past. Contaminants within the stormsewer system could represent a threat to sewer maintenance workers. The nearby stormsewer discharges to the Willamette River, so waste releases to the stormsewer could have contaminated river sediments and represent a longterm threat to the river s aquatic life and wildlife. Subsurface investigaitons have indicated contamination of soils below the site foundation by metals, VOCs, and acids. A Focused Feasibility (completed in 2013 and included in WebDocs) document the contaminaiton and proposed Interim Remedial Measures.

Hazardous Waste Summary:

. Waste code: D001
. Waste name: IGNITABLE WASTE

. Waste code: D002
. Waste name: CORROSIVE WASTE

. Waste code: D003
. Waste name: REACTIVE WASTE

. Waste code: D006
. Waste name: CADMIUM

. Waste code: D007
. Waste name: CHROMIUM

. Waste code: D008
. Waste name: LEAD

. Waste code: D011

OREGON PLATING COMPANY INC (Continued) **1000236252**

. Waste name: SILVER

. Waste code: D018
. Waste name: BENZENE

. Waste code: D039
. Waste name: TETRACHLOROETHYLENE

. Waste code: D040
. Waste name: TRICHLORETHYLENE

. Waste code: F002
. Waste name: THE FOLLOWING SPENT HALOGENATED SOLVENTS: TETRACHLOROETHYLENE, METHYLENE CHLORIDE, TRICHLOROETHYLENE, 1,1,1-TRICHLOROETHANE, CHLOROBENZENE, 1,1,2-TRICHLORO-1,2,2-TRIFLUOROETHANE, ORTHO-DICHLOROBENZENE, TRICHLOROFLUOROMETHANE, AND 1,1,2, TRICHLOROETHANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

. Waste code: F006
. Waste name: WASTEWATER TREATMENT SLUDGES FROM ELECTROPLATING OPERATIONS, EXCEPT FROM THE FOLLOWING PROCESSES: (1) SULFURIC ACID ANODIZING OF ALUMINUM; (2) TIN PLATING ON CARBON STEEL; (3) ZINC PLATING (SEGREGATED BASIS) ON CARBON STEEL; (4) ALUMINUM OR ZINC-ALUMINUM PLATING ON CARBON STEEL; (5) CLEANING/STRIPPING ASSOCIATED WITH TIN, ZINC, AND ALUMINUM PLATING ON CARBON STEEL; AND (6) CHEMICAL ETCHING AND MILLING OF ALUMINUM.

. Waste code: F007
. Waste name: SPENT CYANIDE PLATING BATH SOLUTIONS FROM ELECTROPLATING OPERATIONS.

. Waste code: F008
. Waste name: PLATING BATH RESIDUES FROM THE BOTTOM OF PLATING BATHS FROM ELECTROPLATING OPERATIONS IN WHICH CYANIDES ARE USED IN THE PROCESS.

. Waste code: F009
. Waste name: SPENT STRIPPING AND CLEANING BATH SOLUTIONS FROM ELECTROPLATING OPERATIONS IN WHICH CYANIDES ARE USED IN THE PROCESS.

. Waste code: NA
. Waste name: NA

. Waste code: NONE
. Waste name: None

Biennial Reports:

Last Biennial Reporting Year: 2017

Annual Waste Handled:
Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET,

OREGON PLATING COMPANY INC (Continued) **1000236252**

WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.
Amount (Lbs): 417.5

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.
Amount (Lbs): 32399.1

Waste code: D003
Waste name: A MATERIAL IS CONSIDERED TO BE A REACTIVE HAZARDOUS WASTE IF IT IS NORMALLY UNSTABLE, REACTS VIOLENTLY WITH WATER, GENERATES TOXIC GASES WHEN EXPOSED TO WATER OR CORROSIVE MATERIALS, OR IF IT IS CAPABLE OF DETONATION OR EXPLOSION WHEN EXPOSED TO HEAT OR A FLAME. ONE EXAMPLE OF SUCH WASTE WOULD BY WASTE GUNPOWDER.
Amount (Lbs): 417.5

Waste code: D006
Waste name: CADMIUM
Amount (Lbs): 100

Waste code: D007
Waste name: CHROMIUM
Amount (Lbs): 158966.9

Waste code: D008
Waste name: LEAD
Amount (Lbs): 6054

Waste code: D011
Waste name: SILVER
Amount (Lbs): 8392

Waste code: F007
Waste name: SPENT CYANIDE PLATING BATH SOLUTIONS FROM ELECTROPLATING OPERATIONS
Amount (Lbs): 271480

Waste code: F008
Waste name: PLATING BATH RESIDUES FROM THE BOTTOM OF PLATING BATHS FROM ELECTROPLATING OPERATIONS WHERE CYANIDES ARE USED IN THE PROCESS.
Amount (Lbs): 271480

Waste code: F009
Waste name: SPENT STRIPPING AND CLEANING BATH SOLUTIONS FROM ELECTROPLATING OPERATIONS WHERE CYANIDES ARE USED IN THE PROCESS.
Amount (Lbs): 271480

Environmental Interest/Information System
OR-DEQ (Oregon - Department Of Environmental Quality) is a regulatory agency whose job is to protect the quality of Oregon's Environment. DEQ uses a combination of technical assistance, inspections and permitting to help public and private facilities and citizens understand and comply with state and federal environmental regulations.

OSHA ESTABLISHMENT

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

OR-DEQ (Oregon - Department Of Environmental Quality) is a regulatory agency whose job is to protect the quality of Oregon's Environment. DEQ uses a combination of technical assistance, inspections and permitting to help public and private facilities and citizens understand and comply with state and federal environmental regulations.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
OR-DEQ (Oregon - Department Of Environmental Quality) is a regulatory agency whose job is to protect the quality of Oregon's Environment. DEQ uses a combination of technical assistance, inspections and permitting to help public and private facilities and citizens understand and comply with state and federal environmental regulations.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Decode for NarcdID: Contamination
NARR Comments: (12/05/2013 KPD/VCS) Fifteen borings were advanced at the site in December 2010 as part of an environmental assessment. Twenty soil samples and five sub-slab vapor samples were analyzed for petroleum products and volatile organic compounds. Diesel and VOCs were detected in all five vapor samples. Gasoline and VOCs were detected in the soil in the NW corner of the building, and diesel was detected in a soil sample from the SW quarter of the block. The consultant determined that the extent of vapor concerns at the site needed to be better defined. Ten additional soil samples were collected from borings advanced through the floor of the building in December 2011. No petroleum products were detected in the samples. Additional borings were advanced through the sidewalk along 3rd Avenue. Gasoline and Stoddard solvent were detected in soil samples near the SW corner of the block. Groundwater was encountered at 20-25 ft bgs and was impacted with gasoline and diesel. In January 2012, four soil gas samples were collected from eight feet beneath 3rd Avenue and Ash Street. Gasoline and VOCs were detected in all four samples, with the highest concentrations beneath 3rd Avenue roughly mid-block between Ankeny and Ash. In February, samples were collected on the west side of 3rd Avenue (across from the site) to determine the extent of contamination. No petroleum products were detected in the soil, but one groundwater sample showed gasoline and diesel, and a soil gas sample showed gasoline and VOCs.

NARR Comments: Sub-slab vapor samples collected from beneath the building showed diesel and volatile organic compounds (VOCs). However, significant concentrations of VOCs were only detected in one soil sample beneath the NW corner of the building. Gasoline and Stoddard solvent were detected in deeper soil samples (15-25 ft bgs) beneath the sidewalk along 3rd Avenue on the west side of the building. Gasoline and diesel were detected in groundwater (20-25 ft bgs) beneath 3rd Avenue. Not reported

Decode for NarcdID: Site History
NARR Comments: Cleaning and dyeing companies were established on the block as of the first decade of the 1900s. Star Laundry, on the NE corner of the block, was replaced by a creamery by 1924. Ankeny Auto Service was established in the NW quarter of the block by 1935. As of 1950, the site was occupied by Ankeny Auto Service (NW quarter), Enkes City Dye Works (SW quarter), and a carpet cleaning company (SE quarter). (The NE quarter of the block was vacant). Enkes apparently left in the mid-1950s and was replaced by the Salvation Army, followed by Ankeny soon after 1960. The Salvation Army reportedly purchased the property in February 1964, and operated there until about 2010. The building is currently vacant. Prospective purchasers of the property submitted applications for a Prospective Purchaser Agreement (PPA) to DEQ in January 2011 and March 2012. Both applicants completed environmental investigations at the site, but each ultimately backed out (in June 2011 and May 2012, respectively) before purchasing the property or completing a PPA. A third PPA application was received in March 2013, and a proposed Consent Judgment PPA was released for public comment in June 2013. No comments were received. The Consent Judgment was finalized in November 2013 and signed by the court on December 5, 2013.

OAK TOWER REDEVELOPMENT (Continued) **S106980962**

NARR Comments: Bunker fuel/heating oil - mix of mostly diesel and heavy range hydrocarbons - contains polynuclear aromatic hydrocarbons. May be some limited groundwater impacts from petroleum hydrocarbons. Trichloroethene and perchloroethene were detected in groundwater at the site, but were determined to have originated from off-site sources and not in need of further investigation.

Decode for NarcdID: Remedial Action
NARR Comments: (5/4/05 CK/ICP) Nine soil push probes were advanced and groundwater samples collected in 2002, during a Level II Environmental Site Assessment. (12/6/06 MGreenburg/ICP) Residual contaminants are below site-specific Risk-Based Contaminant levels for Excavation Worker soil contact and Urban Residential and Occupational Volatilization to Indoor/Outdoor Air pathways. Therefore, DEQ has made a no-further-action determination for this site.

Environmental Interest/Information System
AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

Hazardous Waste Summary:

. Waste code: NONE
. Waste name: None

Violation Status: No violations found

FINDS:

Registry ID: 110070309103

Environmental Interest/Information System
OSHA ESTABLISHMENT

Registry ID: 110004807987

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

ICIS (Integrated Compliance Information System) is the Integrated

MR CAR WASH (Continued) **1001485738**

Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

Environmental Interest/Information System

OR-DEQ (Oregon - Department Of Environmental Quality) is a regulatory agency whose job is to protect the quality of Oregon's Environment. DEQ uses a combination of technical assistance, inspections and permitting to help public and private facilities and citizens understand and comply with state and federal environmental regulations.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Updated By: GWISTAR
Updated Date: 06/04/2003
Decode for NarcdID: Contamination
NARR Comments: (7/5/01 MTP/VCP) A Phase I, Phase II with sampling, and Pre-Remedial (Pre-RI) investigations have been conducted at the site. The Phase I report provides a comprehensive survey of historic site activities and identified former dry cleaner sites, service stations, and possible USTs associated with the stations and/or hotels as possible contaminant sources. Soil and groundwater sampling conducted in the Phase II and Pre-RI investigations showed that service station and/or associated current/former USTs, and asphaltic roofing material are contaminant sources at the site. A risk screening indicated that arsenic and a number of PAHs in soil, and arsenic, lead, and benzo(a)pyrene in groundwater, are contaminants of potential concern (COPCs) at the site. Because no VOC analyses were conducted for soil, the assessment of the dry-cleaning sites as potential contaminant sources does not appear complete. (4/1/03 MTP/VCP) Additional investigation conducted in March 2002 further refined the extent of contamiation. VOCs were not detected at levels of concern. PAHs were detected above risk-based concentrations (RBCs) in soil. A number of PAHs, lead and arsenic, and the VOCs trichloroethene (TCE), naphthalene, and vinyl chloride have been detected above their respective US EPA Region 9 Preliminary Remediation Goals (PRGs) for tapwater.

Decode for NarcdID: General Site Description
NARR Comments: The site has been vacant since 1988. Portions of the site were developed as early as 1889 (blacksmith, paint shop). At least three dry-cleaning sites and two service stations were present at the site from as early as the mid-1920s to the 1960s. Hotel Victoria (1931-1960) and the Hoyt Hotel (1911-1977) also operated at the site. A Pacific Trailways bus depot operated on-site between 1980-1985. Underground storage tanks were expected to be associated with the service stations and possibly the hotels. PDC acquired the property from Hood Stages Inc., doing business as Pacific Trailways, Inc., in October 1977.

NARR Comments: Petroleum products and compounds, such as polynuclear aromatic hydrocarbons (PAHs) in soil, and trimethylbenzene in groundwater. PAHs in soil also appear related to asphaltic roofing materials. Possibly chlorinated hydrocarbons from dry-cleaning operations. Imported fill of unknown origin may be a source of arsenic in soil and groundwater.

Decode for NarcdID: Pathways & Other Hazards
NARR Comments: Surface soil, subsurface soil, groundwater, and air through dust and volatilization. The site is located about 1000 feet west of the Willamette River. Relatively low concentrations of arsenic, lead, and PAH benzo(a)pyrene in groundwater do not appear to pose a threat to the Willamette River, but are present at concentrations above EPA Region 9 Preliminary Remediation Goals (PRGs) for tap water. There may not be a beneficial use for groundwater in the locality of the facility.

NARR Comments: Initial DEQ oversight was provided under an Independent Cleanup Program (ICP) agreement. Because the site investigation is proceeding to the risk assessment phase, DEQ has determined that future DEQ oversight should be conducted under a standard VCP Letter Agreement. A Letter Agreement was sent to PDC in March 2003.

NARR Comments: (7/5/01 MTP/VCP) PDC completed a Pre-RI report in March 2001, and joined DEQ's Voluntary Cleanup Program for review of site reports and determination of the <quot>no further action<quot> status at the site. PDC had indicated that site characterization is complete and

PDC BLOCK R (Continued) **S106878666**

with DEQ concurrence, has proposed conducting a focused risk assessment to address soil contamination, and a beneficial groundwater use assessment. DEQ began review of the site documentation in June 2001 and is preparing comments. (4/1/03 MTP/VCP) DEQ presented a scope of work for additional field investigation in a memorandum dated July 24, 2001. Additional investigation was conducted in March 2002, and consisted of advancing 5 direct-push borings for soil sample collection, and sampling of the existing monitoring wells. DEQ reviewed the resulting RI report, although further evaluation of the extent of PAH contamination was suggested. (11/5/04 MTP/VCP) PDC has conducted a removal of 220 tons of asphaltic roofing material and petroleum-contaminated soil.

Decode for NarcdID: Health Threats
NARR Comments: The primary exposure pathway appears to be direct contact, incidental ingestion/inhalation of occupational site workers to polynuclear aromatic hydrocarbons (PAHs) and arsenic. Direct exposure of site utility/trench workers to contaminated surface and subsurface soil may be possible. Relatively low concentrations of PAHs in groundwater do not appear to pose a threat to the Willamette River, but are present at concentrations above EPA Maximum Contaminant Levels (MCLs). There may not be a beneficial use for groundwater in the locality of the facility.

Narrative:
Narrative Id: 7724
Incident Id: 060073
Incident Narrative: HM 06 responded to the above address where Engine 1 had already secured the scene and did a preliminary site recon. Upon our arrival had two of the members make entry in turnouts and SCBA. All monitors were within normal limits. Contamination seemed to be contained to the original package. A small portion of the envelope was removed for further testing. It was determined to be motor oil. The original package was released to the Citizen and Immigration Service. Hazmat 06 cleared and returned in service. 1 tablespoon was released.

Environmental Interest/Information System
US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

Updated Date: 11/20/2017
Decode for NarcdID: Site History
NARR Comments: The site was first developed by the Northern Pacific Terminal Company of Oregon between 1890 and 1906 with a railroad engine house and warehouse. The City of Portland acquired the site in 1913 and constructed a fire house. The fire house was operated by the Portland Fire Department until about 1950. The site was conveyed back to Northern Pacific (subsequently known as the Portland Terminal Railroad Company) in 1953. PTRR used the fire house as a carpenter shop until 1980 and then as a small office space. The Portland Development Commission (PDC) acquired the site in 1987, and leased the fire house as office space until 1997. The building has remained vacant since then.

Incident Status:	Closed
Material:	Oil - Hydraulic
Quantity:	25
Unit of Measure:	Gallons
Release Date:	09/28/2016
Description:	Recology reporting 20-25 gallons of hydraulic fluid to pavement and drain. Release occurred from a burst hydraulic line on a side load garbage truck. Recology did initial clean up, but also contacted Bravo Environmental to finish clean up; vac truck. Spill did impact a drain but was contained in the drain. Caller will be contacting Portland Spill line.

Updated By: Not reported
Updated Date: 12/17/2002
Decode for NarcdID: Contamination
NARR Comments: (4/10/95 KAC/SRS) Location of Broadway Cab Company service center for its taxicab fleet from the mid-1950s until about 1985. The site contained two 10,000-gallon underground storage gasoline tanks, installed in the mid-1950s. A 5,000-gallon tank was installed in 1974. One or both of the 10,000-gallon tanks were unearthed in 1976 and subsequently relined after water was detected in the gasoline. The site is also located directly south of a historic coal and oil gasification facility known as the Portland Gas Manufacturing Facility (see ECSI #1138). A large volume of coal and oil tar wastes was estimated to have been generated at this facility; however, no records indicating how they were disposed of have been located, so it is possible that these wastes were disposed of at or near the plant site - possibly on the Broadway Cab site. Wastes removed from the site were disposed of at Porter Yett Landfill (pit). The City of Portland acquired the site and constructed a parking structure and shops. Wells were installed in 1991 and gasoline compounds were found in the groundwater beneath the site and across Davis Street to the south.

NARR Comments: Leaking underground storage tanks. Disposal of coal tars from old Portland Gas Manufacturing Facility. Source of benzene contamination is leakage from underground gasoline storage tanks formerly located on-site. Acenaphthalene is a polynuclear aromatic hydrocarbon (PAH) that is a coal/oil tar constituent. PAHs are not very soluble in water but are being mobilized by the gasoline. Time of release: during operation of the cab company.

Updated Date: 11/01/2016
Decode for NarcdID: Contamination
NARR Comments: (4/27/88 MER/SRS) This site covers four city blocks and was used for a coal gas manufacturing facility from 1860 to 1906. In 1906, the plant converted to produce oil gas and carbureted water gas. Portland Gas Company discontinued operation of the gas plant in 1913. Based on data for similar coal and oil gas plants, the major wastes likely are: coal and oil tars, process wastewater, and spent iron oxide. Coal and oil tars are composed mainly of PAHs. Process wastewaters may contain dissolved aromatic hydrocarbons and ammonia. Spent iron oxides contain iron, sulfur, and some heavy metals. It is estimated that coal tar production at the site could have been as much as 44,000 gallons per year, and oil tar around 59,000 gallons per year. There was no information available as to how these wastes and products were disposed of, but it is historically likely that they were disposed of on-site. It is also reasonable to assume that process wastewater was discharged to the Willamette. (6/22/92 KPD/SAS) Much of the above information was derived from a federal Preliminary Assessment (PA) performed by Ecology & Environment (E&E) for EPA in 1987. Although no sampling was performed, E&E concluded that any remaining contamination would be immobile and blocked from reaching the Willamette River by the seawall, and so recommended no further action be taken. In 1988, excavation for a parking garage immediately south of the site encountered <quot>green<quot> clay and

PORTLAND GAS MANUFACTURING SITE (Continued) **S106497096**

a strong gasoline odor at least 20 feet below the surface. Coal tar was found below this. Although some contamination was excavated and shipped off-site, a major cleanup was not attempted. Instead, DEQ approved a plan to monitor and vent gasoline vapors (to prevent the vapors from building up in the basement of the garage). Also in 1988, the Portland Development Commission (PDC) hired Sweet-Edwards/EMCON to look at the site as part of a study to extend Waterfront Park north from the Burnside Bridge to the Steel Bridge. As expected, contaminants consistent with coal and oil tars were found at the Portland Gas site. EMCON agreed with E&E that the tars posed no public health threat so long as they were not disturbed by excavation. See ECSI #383 for more information on the parking garage, and ECSI #876 for more information on North Waterfront Park. (3/7/09, DJH/VCP) Based on a February 2009 draft Historical Summart Report submitted by NW Natural (Hahn & Associates), MGP operations included 5 city blocks (5,6,7,15,23) and included use of coal, carbureted water (oil/water mixture), and crude oil as feed stock. Manufacturing ceased in 1913. Investigation is ongoing to assess sediment impacts in the Willamette River adjacent to the site, and in upland areas adjacent to the river. During Phase I investigation activity in the site uplands, and in Willamette River sediment adjacent to the site, MGP contamination was detected. The most notable contamination was in sediment, where oil, tar, and black solid material (lampblack?) were detected off of Block 5, where gas manufacturing activities were concentrated. Additional investigation completed in the 2010 through 2015 time period has identified elevated VOCs and PAHs in groundwater near the eastern site boundary, most notably at 75' below ground surface. Significant VOC, PAH, petroleum, and metals contamination has also been detected in sediment adjacent to Blocks 4 and 5. In-water contamination includes a area of tar-like material at the sediment surface; significant debris associated with sea wall construction has also been found in the contamination area.

NARR Comments: Based on completed site characterization and source control evaluation, upland (direct contact) concerns are low given filling of the former industrial area and subsequent redevelopment. In the upland, groundwater contamination is present along the seawall area, and is expected to discharge to the Willamette River. Within the river, contaminated sediment has been found which poses a risk to both human and ecological receptors.

Updated Date: 10/21/2018
Decode for NarcdID: Remedial Action
NARR Comments: 3/7/09, DJH/VFCP) Remedial investigation planning begun October 2008. Field Sampling Plan for Willamette River sediment investigation approval by DEQ in mid 2009, and sampling completed in August. Upland Source Control Investigation Work Plan approved by DEQ in September 2009, and work completed in August 2009. A draft Sediment Investigation Report was submitted to DEQ in December 2009. An Upland Source Control Investigation Report was submitted in March 2010. In May 2010 DEQ identified remaining source control data gaps. (9/20/12, DJH). See SUMMARY text. Four rounds of upland groundwater investigation completed, along with Phase 2 sediment sampling in the Willamette River adjacent to the site. Phase 3 work consisting of additional sediment collection, seepage measurements, pore water sampling, and geophysical survey is ongoing as of September 2012. (11/14/13) Upland and in-water investigation has been completed, and source control risk analysis is in progress. Excess risk has been identified for upland groundwater near the seawall, and within

PORTLAND GAS MANUFACTURING SITE (Continued) **S106497096**

Willametter River sediments bordering the site. A feasibility study is pending. (11/1/16) Feasibility study completed and approved by DEQ. Staff Report outlining proposed remedial actions for groundwater and sediment contamination completed October 2016. Public notice completed. (06/06/18). Record of Decision issued in June 2018 following public notice and comment, including response to EPA and tribal comments. RD/RA Work Plan approved in July 2018. (10/21/18). 50% design documents submitted to DEQ in June 2018. Following comment and response, 90% Design submitted to DEQ in October 2018 for review. DEQ response expected in early December 2018. Permitting work associated with in-water action ongoing.

NARR Comments: [May 2017] A comprehensite source control investigation effort has been completed at the site under a Consent Order with DEQ. Work has included installation and monitoring of numerous upland wells to determine the potential for contaminated groundwater to discharge to the Willamette River, and a comprehensive investigation of river sediment and water adjacent to the site.

 Near the seawall (eastern upland boundry), groundwater impacts have been observed in upland wells, notably in the 65-75' bgs, with MGP constituents including benzene and naphthalene observed. Groundwater above and below has minimal or no contamination. In the river, significant sediment contamination has been detected off of Block 4 and 5, and to a lesser extent Block 21. Contaminants detected included VOCs, PAHs, metals, and cyanide (all MGP waste constituents). Block 5 was the locus of MGP operations at the former PGM facility. As of summer 2012, two rounds of sediment investigation had been completed, and the extent of riverbed contamination generally defined.

 In October 2012, additional source control work was completed at DEQ's request. Work included sediment sampling to define the lateral extent of sediment impacts, pore and river water sampling, seismic profiling of the riverbed, and a diver survey of riverbed debris and a tar area. Upland work included a transducer study using site wells. Results were presented in a site investigation report presented to DEQ.

 A Draft Integrated Sediment Investigation/Source Control Evaluation Report, including a comprehensive risk screening for both upland and in-water contamination, was completed by Anchor for NW Natural in April 2013. Based on comments by DEQ, a Revised Integrated Sediment Investigation/Source Control Evalution Report was submitted in Aug. 2013. Risk screening identified elevated concentrations of MGP contaminants in both upland groundwater (largely in the 65-75' bgs zone), and Willamette River sediment adjacent to the site.

 To finalize the RI and risk screening work and prepare for a site feasibility study, a Supplement to the Integrated Sediment Investigation/Source Control Evaluation (Nov. 2013) was submitted by NW Natural. A revised Supplement was approved by DEQ in Feb. 2014.

 Two FS-related documents, a FS Work Plan and Annotated FS Outline were submitted by NW Natural in early 2014. The work plan outlined additional in-water investigation work including porewater and seepage rate measurements, and advancing

PORTLAND GAS MANUFACTURING SITE (Continued) **S106497096**

cores to better delineate sediment impacts in the northeast portion of in-water contamination. This work was approved in June 2014 and implemented that summer.

 An Integrated Feasibility Study report was submitted for DEQ review in December 2015. DEQ issued comments on the FS dated February 11, 2016. Under the draft FS, the proposed remedy consists of a combination of active (dredging, capping) and passive (natural attenuation) elements. The FS was finalized (Aug. 2016) and subsequently approved by DEQ. A DEQ Staff Report outlining the proposed site remedy has been prepared (Oct. 2016) and approved by DEQ management. The document is available on <quot>Webdocs.<quot> Public notice of the proposed remedial action was begun on November 1, 2016, and will continue for 30 days. As requested by EPA and Tribes, the comment period was extended through January 2017. Numerous comments were received. DEQ's Record of Decision is pending. Contamination in the 5-block upland portion of the site is not included in the proposed remedy. Given filling and redevelopment that has occurred, the <quot>direct contact<quot> risk is considered low, and will likely be evaluated in the future. DEQ previously issued a conditional NFA for Block 15, which lies within the historical <quot>footprint<quot> of PGM upland activities. Record of Decision issued by DEQ July 3, 2017. Included response to EPA, tribal, and public comments and evaluation of remedy consistency with that for Portland Harbor. A Pre-Design Work Plan was completed by NWN in August 2017 and approved by DEQ. Work including an updated bathymetric survey, diver survey, and sediment collection and was completed in September/October 2017. Remedial design is in progress, and included submission of 50% design materials in June 2018. A final RD/RA Work Plan was approved in July 2018, and 90% design documents were received in late October 2018. Remedy implementation is planned for 2019.

Environmental Interest/Information System
OR-DEQ (Oregon - Department Of Environmental Quality) is a regulatory agency whose job is to protect the quality of Oregon's Environment. DEQ uses a combination of technical assistance, inspections and permitting to help public and private facilities and citizens understand and comply with state and federal environmental regulations.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Decode for NarcdID: Contamination
NARR Comments: (11/8/01 GMW/SAS) This is one of three sites in Oregon that a researcher at George Mason University identified as a former lead-smelting facility. The U.S. EPA requested that DEQ evaluate these three sites (ECSI #3066, 3067, and 3090), and determine whether past industrial operations might have left behind lead contamination that poses threats to human health or the environment. (1/29/02 CJB/SAS) There are no obvious signs of contamination on exterior soils or on the ground. A 1991 Level I ESA failed to fully characterize all potential conduits. The building is in much the same condition at present as when it was last occupied by the Pacific Metals Co. Given the persistence of metal contaminants, residual indoor contaminants remain as a concern. (February 2003) Dust analysis documented lead and arsenic concentrations in wipe samples collected in the building interior. Two separate dust abatement events were conducted in the spring of 2003. Confirmation wipe samples for dust analysis documented the decrease in lead concentrations and the overall abatement of dust in the building. With the removal of dust, the threat of a release to the environment was diminished.

Updated Date: 07/26/2016
Decode for NarcdID: Remedial Action
NARR Comments: (1/17/02 CJB/SAS) Recommend Expanded Preliminary Assessment as a high priority. Insufficient information to add site to the Confirmed Release List. (4/03 AVoss) Property owner conducting interior dust and asbestos abatement. Anticipated completion in spring of 2003. (5/03) Owner completed dust abatement and resolved other site issues. No further action determination in May 2003 because the threat of release to the environment from the dust had been diminished. NFA stated that building materials may be subject to DEQ solid waste rules if disposed of. DEQ's NFA does not apply to OR OSHA regulations. (7/16 S.Greenf) Project closeout activities were completed between Jan and March 2016 including building demoltion, asbestos abatement, hazardous waste removal, supplemental soil sampling, and underground injection control system decomissioning. Work was completed in accordance with the Contaminated Media Management Plan approved by DEQ on September 14, 2015. DEQ issued an Addendum NFA on July 20, 2016.

NORTHWEST NATURAL GAS CO ONE PAC SQUARE (Continued) **1004579790**

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

GREENHOUSE GAS REPORTER

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

Environmental Interest/Information System
OR-DEQ (Oregon - Department Of Environmental Quality) is a regulatory agency whose job is to protect the quality of Oregon's Environment. DEQ uses a combination of technical assistance, inspections and permitting to help public and private facilities and citizens understand and comply with state and federal environmental regulations.

US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

Narrative:
NARR ID: 5726194
NARR Code: Contamination
Created By: Not reported
Created Date: 12/17/2002
Updated By: DHAFLEY
Updated Date: 07/07/2014
Decode for NarcdID: Contamination
NARR Comments: (2/6/92 ALB/SAS) In 1988, the Portland Development Commission (PDC) had an environmental audit of the site performed as a prelude to development of the site. The history of the site was uncertain, and the PDC apparently was concerned that contamination found on neighboring sites might have impacted this site. Soil borings and analysis of soil and groundwater samples indicated the site holds construction rubble, some oily soils, some coal tar residues, and low levels of gasoline constituents. The oily soil was detected near the south end of the site while the BTEX and coal tar constituents were found at the north end at a depth of 30 - 31.5 feet. The Old Town Parking/Helistop Structure (ECSI #383) site is across Front Avenue from the middle portion of the site. It appears that during the period of operation of the coal gasification plant near this site, coal tar residues were deposited rather widely in the area. Coal tar residues are of extremely low mobility and are generally considered

NORTH WATERFRONT PARK (Continued) **S105613783**

to be a low-level hazard, in the absence of organic solvents. While samples did indicate the presence of BTEX compounds often associated with gasoline, neither gasoline nor diesel were detected. The benzene contamination in the groundwater exceeds the the federal drinking water standard. Groundwater in the area is not likely to be used for drinking purposes, however. Available information indicates that area wells are air conditioning and other industrial application wells, which appear to draw from deeper aquifers. The contamination is not believed to be presently posing a threat to human health or the environment. (7/16/92 KPD/SAS) The coal tar contaminants at the north end of the park came from the Portland Gas Manufacturing site (ECSI #1138), the site of a former coal gasification plant. The Old Town Parking site (formerly Broadway Cab) is active in the Site Response Section. The source of the contaminants at the south end of the park is unknown.

Decode for NarcdID: Remedial Action
NARR Comments: (2/6/92 ALB/SAS) Site Assessment has reviewed the site files and determined that the contamination does not pose an immediate threat through direct contact or drinking water use. It is recommended that no action be taken on this site until the results of the Site Response project (ECSI #383) soil/gas survey are received and evaluated. (7/16/92 KPD/SAS) Contamination from Broadway Cab has not spread to Waterfront Park. However, Site Assessment recommends a Preliminary Assessment (PA) to more fully evaluate site contamination and exposure pathways.

NARR Comments: [July 2014] North Waterfront Park is an old site and a <quot>Study Area<quot> with several adjacent member sites, such as Broadway Cab/Old Town Helistop (ECSI# 383) and Portland Gas Manufacturing (PGM - ECSI#1138). A NFA has been issued for Broadway Cab, and a DEQ source control evaluation is ongoing at PGM. While no DEQ action is anticipated at the North Waterfront Park site, additional work may occur in the future on adjacent sites added to the Study Area.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System
OR-DEQ (Oregon - Department Of Environmental Quality) is a regulatory agency whose job is to protect the quality of Oregon's Environment. DEQ uses a combination of technical assistance, inspections and permitting to help public and private facilities and citizens understand and comply with state and federal environmental regulations.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

NARR Comments: [Sept. 2015] An ICP Final Report for Block 15 and dated May 29, 2013 was submitted for the site by GeoEngineers. DEQ reviewed the report, which recommended a site NFA, and provided comments in a letter dated June 24, 2013. A Addendum Letter was submitted on September 18, 2013 (GeoEngineers) addressing DEQ comments. DEQ has reviewed the report, and is prepared to move forward with site closure. Because site contamination is addressed via a site cap (site is covered with building and parking), only a conditional NFA can be issued. DEQ will proceed with: -closure memo -public notice and comment -approval of deed restriction and CMMP Staff report/closure memo completed August 30, 2014, with public notice of DEQ's proposed approval of site cap starting in September. August 2014 CMMP approved by DEQ. Public notice of DEQ's proposed conditional NFA decision was completed in September 2014. No comment was received. A conditional NFA letter was issued by DEQ on November 2014. DEQ's NFA requires ongoing inspection and maintenance of the site cap. Starting in 2015, cap inspection, maintenance as necessary, and submission of inspection of reports to DEQ NWR Cleanup is necessary. After five years of annual inspection throuigh 2019, DEQ will determine whether less-frequent monitoring is acceptable.

NARR Comments: Site owner WREH has requested that the subject property be <quot>decoupled<quot> from the multi-block Portland Gas site, which has included Block 15. This request was made in May 2012. DEQ has assigned a separate ECSI number for this site; it will remain <quot>associated<quot> with Portland Gas Mfg. (ECSI# 1138). WREH has discussed entering DEQ's VCP and working towards a no further action determination for the site. An ICP Final Report for Block 15 and dated May 29, 2013 was submitted for the site by GeoEngineers. DEQ reviewed the report, which recommended a site NFA, and provided comments in a letter dated June 24, 2013. A Addendum Letter was submitted on September 18, 2013 (GeoEngineers) addressing DEQ comments. DEQ has reviewed the report, and is prepared to move forward with site closure.
